

Catalog 624-23

Trailblazer®
Air-Cooled Scroll Compressor Chillers
With High Efficiency Variable Speed Fan Technology

Model AGZ-E
030 to 241 Tons (100 to 840 kW)
HFC-410A Refrigerant
60/50 Hz

Air-Cooled Chiller Products

The Trailblazer® family of air-cooled scroll chillers continues the Daikin Applied legacy of high quality, high efficiency, latest technology and quiet operation. These features make the Trailblazer® family the best overall value in air-cooled packaged chillers available today. The Trailblazer® series offers a wide selection of units from 30 to 241 tons with dual refrigerant circuits available as packaged units with optional heat recovery or pump packages, or as remote evaporators.

Efficient Operation

The Trailblazer® units utilize environmentally acceptable R-410A refrigerant and meet the performance requirements of ASHRAE Standard 90.1 for efficiency. Excellent part-load performance is achieved with four or six scroll compressors. A variable speed condenser fan option is also available to provide even higher part load efficiency. High overall efficiency = lower annual energy costs.

RapidRestore® and Fast Loading

When power has been interrupted, the Trailblazer® has the capability to restore cooling quickly by using RapidRestore® and Fast Loading. These options make Trailblazer® ideal for mission critical buildings, data centers, healthcare facilities, and manufacturing processes. Once power is restored after a power loss duration of up to 180 seconds, the time for a Trailblazer® chiller to restart is less than 125 seconds with the chiller reaching full load within 220 seconds.

Application Flexibility

Trailblazer® units are available as packaged chillers with optional heat recovery or pump packages, as well as remote evaporator configurations. Information on remote evaporator models and factory-installed pump packages can be found in a separate installation manual available on www.DaikinApplied.com.

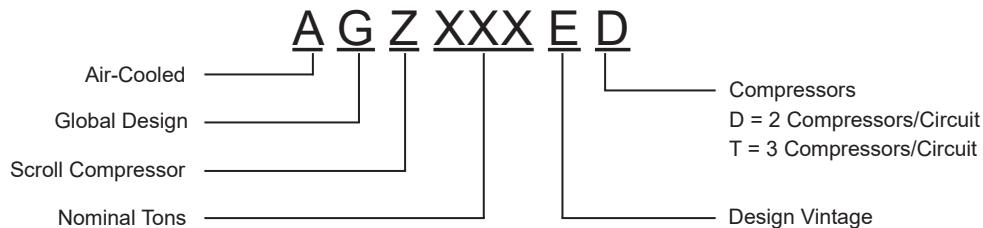

Quiet Operation

The Trailblazer® units live up to the Daikin Applied reputation for low operating sound levels and make these chillers "neighborhood friendly." Full load sound pressure levels as low as 60 dB without insulation.

LEED® Points

For building owners who wish to pursue Leadership in Energy and Environmental Design (LEED®) Green Building Certification, points earned for Optimize Energy Performance (formerly EA Credit 1) are awarded based on overall building efficiency. The high efficiency of the AGZ-E will contribute to the total points earned for this credit. Trailblazer® chillers can also contribute to Enhanced Refrigerant Management (formerly EA Credit 4) qualification which is partially determined by tonnage and refrigerant quantity. Consult with your Daikin Applied sales representative for more information.

CHILLER NOMENCLATURE

Unit Design Features

Daikin Trailblazer® air-cooled chillers are a product of our commitment to offer quiet, reliable, energy efficient equipment, incorporating high quality compressors, and innovative packaging.

Construction

Trailblazer® chillers are factory-assembled and mounted on a heavy-gauge steel base. The base distributes the unit weight for roof loading. Their small footprint allows smaller mounting pads or support structures and is a plus for retrofit or replacement applications.

Compressors

Reliable hermetic scroll compressors with cast iron scrolls and three Teflon® impregnated bearings are used on the Trailblazer® chillers to promote longevity.

Each model has the ability to modulate its capacity. Models with four compressors will have four steps of capacity modulation while models with six compressors will have six steps. Compressors stage on depending on the load of the system. This results in excellent part-load efficiency and reduced annual operating costs.

Features include motor temperature protection, scroll temperature protection, missing phase protection, reverse phase protection, low control circuit voltage protection, short cycling detection and alert, Modbus® communication to system controller, operational and fault history storage, and LED status display.

Evaporator

Trailblazer® units are designed to maximize efficiency in the smallest possible footprint. The evaporator is a compact, high efficiency, dual circuit, brazed plate-to-plate type heat exchanger consisting of parallel stainless steel plates. These heat exchangers provide excellent heat exchange efficiency in a compact footprint and are especially attractive for smaller capacity units. Evaporators are designed and constructed according to, and listed by, Underwriters Laboratories (UL).

Optional Remote Evaporator

Units 30-241 tons with the optional remote evaporator will have the evaporator shipped separately for field mounting and piping to the outdoor unit.

Condenser Coils

Condenser coils are all aluminum alloy microchannel design with a series of flat tubes containing multiple, parallel flow microchannels layered between the refrigerant manifold piping. See "Condenser Coil Options and Coating Considerations" on page 15 for discussion of environmental factors related to material and coating options.

Figure 1: Microchannel Coil

Figure 2: Trailblazer® with Optional Full Louver Package

Optional High Efficiency Variable Speed Condenser Fans

This option (available on 75-241 ton models) adds variable speed drives to the condenser fans on the chiller. The MicroTech® III controller will adjust the speed of the condenser fans using the VFD's to optimize chiller efficiency and maintain proper head pressure. This feature improves part load efficiency substantially and offers the ability to operate in low ambient conditions down to -10°F.

All High Efficiency Trailblazer® models with fully variable speed fans also include a sound reduction mode to allow for reduced-sound operation. Based on a user-settable time schedule, the chiller will enter the reduced noise mode, which will limit the speed of the condenser fans in order to reduce sound levels. This feature is especially helpful in areas that have more rigorous sound restrictions during certain times of day. While the lower fan speed may have a slight impact on the maximum unit capacity during hot outdoor conditions, the chiller can be set to automatically override the fan speed restrictions if additional capacity is needed. This way, the unit will always optimize between required capacity and the lowest sound level possible.

Control System

The MicroTech® III advanced chiller controller surpasses all other microprocessor-based chiller control systems available today. This powerful, user-friendly control system provides the flexibility and performance needed for either stand-alone unit operation or the controller can be easily tied into the building automation system of choice using the Daikin Open Choices™ feature.

Open Choices™ allows one to choose from open standard protocols such as BACnet®, Modbus® and LonWorks® to communicate easily with the building automation system that best meets the facility requirements. These optional communications modules are available factory installed or can be easily field installed.

The MicroTech® III controller's design will not only permit the chiller to run more efficiently, but will also simplify troubleshooting if a system failure occurs. Every MicroTech® III controller is programmed and tested prior to shipment to help provide a trouble-free start-up.

SiteLine™ Building Controls

Daikin makes building automation simpler, more effective and easier to scale than any other controls solution on the market today.

Whether you're overseeing a complex HVAC ecosystem of equipment and buildings or monitoring standalone units, SiteLine Building Controls and Service Solutions will help you create comfortable and sustainable environments where tenants work and live.

Daikin's scalable, cloud-based building automation systems (BAS) instantly and easily optimize the performance of any HVAC ecosystem—including other makes and existing building systems. Plus, our real-time analytics provide effortless insight and enable optimization for energy, indoor air quality (IAQ) and sustainability.

Benefits

- Easy installation with out-of-the box functionality for both new and retrofit applications.
- Simple operation that brings insight to system performance and is intuitive to manage.
- Low upfront costs that enable you to work with other equipment systems
- Scalable solutions for both standalone equipment and building systems.
- Advanced security that protects customer data.

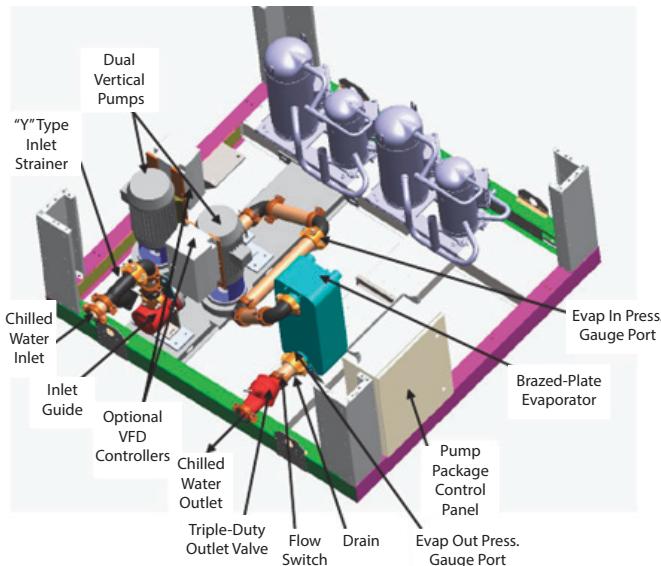

Optional Remote Interface Panel

In addition to the unit-mounted user interface provided with MicroTech® III controls, the Trailblazer® chillers can be individually equipped with a remote user interface. It provides convenient access to unit diagnostics and control adjustments without having to access a rooftop or outdoor location. One remote panel can be connected to up to eight chillers.

Optional Pump Package

The on-board, integrated chilled water pump package provides important benefits:

- Simplifies the chilled water system design and installation
- Provides installation savings by reducing field piping, wiring and control costs
- Saves valuable floor space inside the building.
- Reduces project engineering content
- Greatly reduces pump operating costs with the optional variable flow pump VFD

Figure 3: Optional Pump Package Schematic

Standard Components

Single Pump: Single spring inside seal, vertical, in-line, radially split-case pump, serviceable without breaking pipe connections. The motor and pump rotating assembly can be serviced without removing the pump casing from the line.

Dual Pumps in a Single Casting: Single spring inside-seal vertical, in-line, radially split-case pumps, mounted in a common casting with a common inlet connection and outlet connection and including a flapper valve to prevent recirculation when only one pump is operating. The pumps are designed for duty/standby, not parallel operation. All information and performance curves for the single pump arrangement (Model 4380) can be used for the dual pump arrangement (Model 4392).

The package is also equipped with:

- "Y" type inlet strainer
- combination triple-duty outlet valve containing:
 - discharge shutoff valve
 - check valve
 - flow throttling valve
- combination suction guide with flow stabilizing outlet vanes and stainless steel strainer with a disposable fine-mesh start-up strainer
- mounted and wired flow switch
- factory power and control wiring
- interconnecting piping and insulation of all cold surfaces

Various tank and connection options are available for field mounting. Refer to the schematic in Figure 3 for more information.

Optional Variable Flow VFD

The operating cost savings resulting from using variable chilled water flow via a pump VFD is well known. In the past, however, its usage has been somewhat limited by the cost and uncertainty of field installing the required system pressure differential sensors.

Daikin Applied can now offer flow control through the pump VFD without the need for external pressure sensors. In addition to the sensorless operation, there are three other selectable operating modes:

BAS Input: The pump speed and system flow will be controlled from a customer-supplied BAS input signal.

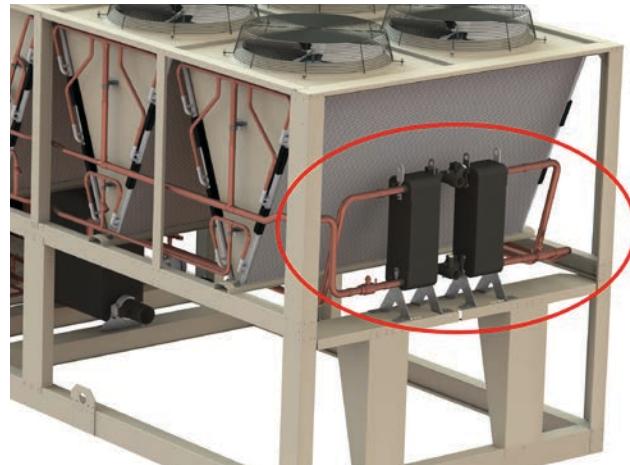

Remote Sensor Control: The VFD is wired to a pressure sensor mounted in the chilled water piping system. This is the standard VFD control when a sensorless VFD is not used.

Locally Selected Constant Speed Control: Provides manual control of the pump speed, overriding any current automatic speed control.

Consult the current version of the installation manual for additional detailed information, which is available from your local Daikin Applied sales office or on www.DaikinApplied.com.

Optional Partial Heat Recovery

Partial heat recovery (available on 75-241 ton models) adds optional factory-installed heat exchangers and control logic to provide hot water for many uses such as dehumidification and pre-heating water for a boiler. This option reduces operating costs by using heat that already exists in the chiller instead of paying for another source of energy.

Figure 4: Partial Heat Recovery Heat Exchangers

Operating and Standby Limits

Table 1: Operating Limits

Maximum standby ambient temperature	130°F (54°C)
Maximum operating ambient temperature	105°F (41°C)
-with optional high ambient package (see "Partial Heat Recovery" on page 14)	125°F (52°C)
Minimum operating ambient temperature (standard control)	32°F (0°C)
-with optional low ambient control (see "High Ambient Operation" on page 13)	-10°F (-23°C)
Leaving chilled water temperature	40°F to 65°F (4°C to 18°C)
Leaving chilled fluid temperatures (with anti-freeze) - Note that in cases of high ambient temperature, the lowest leaving water temperature settings may be outside of the chiller operating envelope; consult Daikin Tools® to ensure chiller is capable of the required lift.	15°F to 65°F (-9°C to 18°C)
Operating chilled water delta-T range	6°F to 16°F (3.3°C to 8.9°C)
Maximum evaporator operating inlet fluid temperature	81°F (27°C)
Maximum evaporator non-operating inlet fluid temperature	100°F (38°C)

Unit Placement

Trailblazer® units are for outdoor applications and can be mounted either on a roof or at ground level. For roof mounted applications, install the unit on a steel channel or I-beam frame to support the unit above the roof. For ground level applications, install the unit on a substantial base that will not settle. Use a one-piece concrete slab with footings extended below the frost line. Be sure the foundation is level within 0.5" (13 mm) over its length and width. The foundation must be strong enough to support the unit weight - see the Dimensions section starting on page 29.

Service Clearance

Sides

- **Models 30-71:** Minimum of 4 feet (1.2 meters)
- **Models 75-241:** It is highly recommended to provide a minimum of 8 feet (2.4 meters) on one side to allow for coil replacement. Coils can be removed from the top, allowing a minimum of 4 feet (1.2 meters) of side clearance; however, the unit performance may be derated.

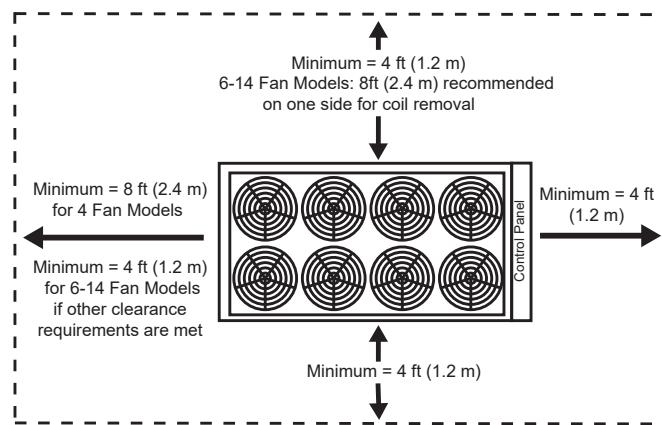

Control Panel End

- **All Models:** Minimum of 4 feet (1.2 meters)

Opposite Control Panel End

- **Models 30-71:**
Minimum of 7.5 feet (2.3 meters)
- **Models 75-241:** Minimum of 4 feet (1.2 meters)

Figure 5: Service Clearance

Operational Spacing Requirements

Sufficient clearance must be maintained between the unit and adjacent walls or other units to allow the required unit air flow to reach the coils. Failure to do so will result in a capacity reduction and an increase in power consumption. No obstructions are allowed above the unit at any height. The clearance requirements shown are a general guideline and cannot account for all scenarios. Such factors as prevailing winds, additional equipment within the space, design outdoor air temperature, and numerous other factors may require more clearance than what is shown. Additional clearances may be required under certain circumstances.

Graphs on the following pages give the minimum clearance for different types of installations and also capacity reduction and power increase if closer spacing is used. The graphs are based on individual cases and should not be combined with other scenarios.

Case 1: Building or Wall on One Side of Unit

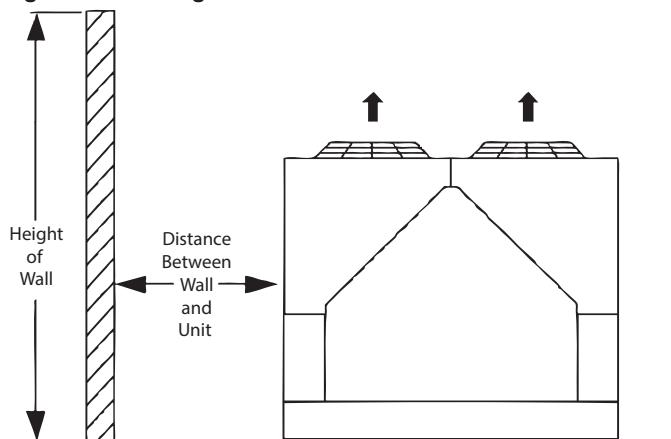

NOTE: Assumes a solid height wall taller than unit. Refer to Case 4 for partial wall openings.

For models AGZ030-101E, maintain a 4 foot minimum from any solid height wall taller than unit.

For models AGZ110-130E, maintain a 6 foot minimum from any solid height wall taller than unit.

For models AGZ140-241E, maintain an 8 foot minimum clearance from any solid height wall taller than unit.

Figure 6: Building or Wall on One Side of Unit

Case 2: Two Units, Side-by-Side

For models 030-180, there must be a minimum of 4 feet between two units placed side-by-side; however, performance may be affected at this distance. For models 191-241, the minimum is 6 feet as closer spacing may cause air recirculation and elevated condenser pressure. Assuming the requirement of one side having at least 8 feet of service clearance is met, Figure 8 below shows performance adjustments as the distance between two units increases.

Figure 7: Two Units, Side-by-Side

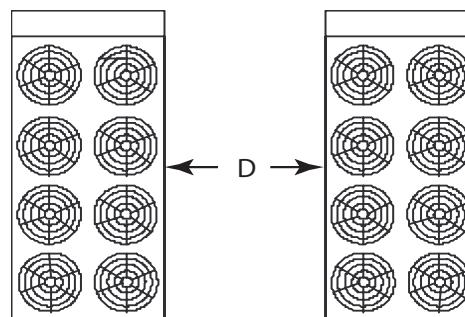

Figure 8: Case 2 - Full Load Capacity Reduction

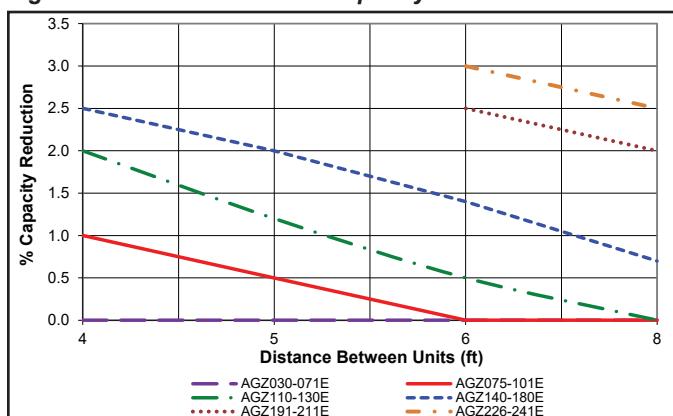

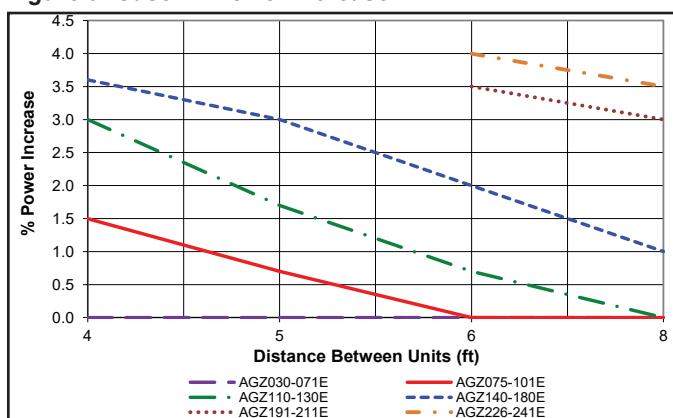

Figure 9: Case 2 - Power Increase

Case 3: Three or More Units, Side-by-Side

For all models, there must be a minimum distance between any units placed side-by-side; however, performance may be affected at this distance. Minimum distances are: models 030 to 071 - 4 feet, models 075 to 101 - 5 feet, models 110 to 241 - 6 feet. Figure 11 and Figure 12 depict Case 3 performance adjustments as the distance between units increases.

NOTE: Data in Figure 11 and Figure 12 is for the middle unit with a unit on each side. See Case 2 adjustment factors for the two outside units.

Figure 10: Three or More Units, Side-by-Side

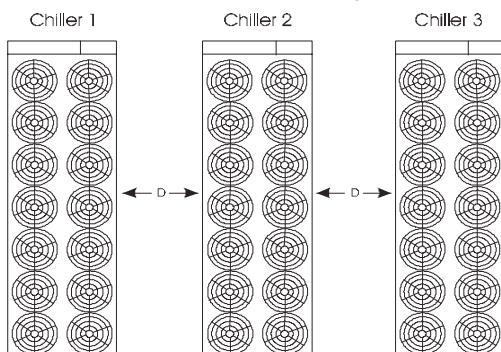

Figure 11: Case 3 - Full Load Capacity Reduction

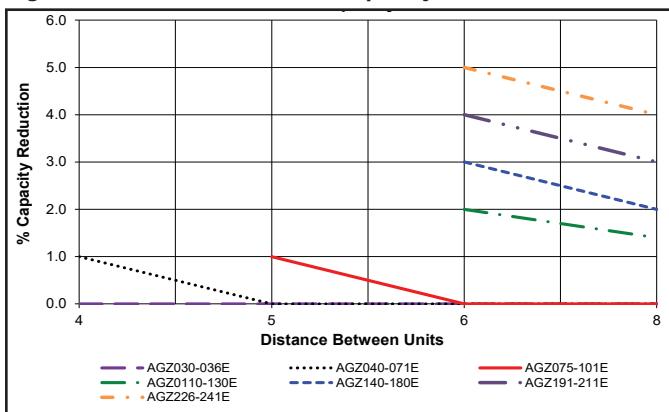

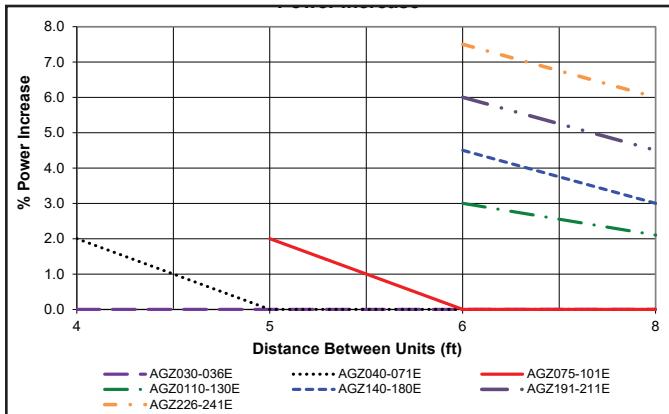

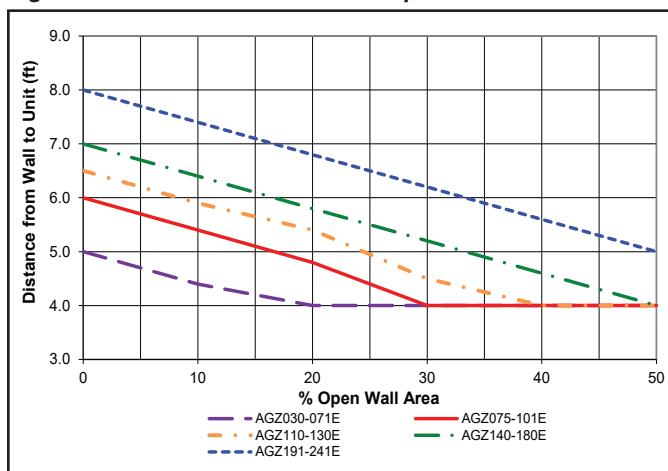

Figure 12: Case 3 - Power Increase

Case 4: Open Screening Walls

Screening walls may be used to help conceal a unit. When possible, design these walls such that the combination of open area and distance from the unit (see Figure 13) does not require performance adjustment. If the wall opening percentage is less than recommended for the distance to the unit, it should be considered as a solid wall. It is assumed that the wall height is equal to or less than the unit height when mounted on its base support. If the wall height is greater than the unit height, see Case 5 for adjustment factors. The distance from the sides of the unit to the walls must be sufficient for service. For uneven wall spacing, the distance from the unit to each wall can be averaged providing no distance is less than 4 feet. Values are based on walls on all four sides.

Figure 13: Case 4 Allowable Wall Open Area

Case 5: Pit Installation

Pit installations can cause operating problems resulting from air recirculation and restriction and require care that sufficient air clearance is provided, safety requirements are met and service access is provided. A solid wall surrounding a unit is substantially a pit and this data should be used.

Steel grating is sometimes used to cover a pit to prevent accidental falls or trips into the pit. The grating material and installation design must be strong enough to prevent such accidents, yet provide abundant open area to avoid recirculation problems. Have any pit installation reviewed by your Daikin Applied sales representative prior to installation to ensure it has sufficient air-flow characteristics, and confirm it has been approved by the installation design engineer to avoid risk of accident. The following de-rates are based on single chiller installations only.

Models AGZ030-071E:

The Case 5 figures for models AGZ030-071E show adjustment factors for pit/wall heights of 4 feet, 5 feet, and 6 feet.

**Chilled Water Piping**

All evaporators and condensers have OGS-type grooved water connections (adhering to Standard AWWA C606) or optional flange connections. The installing contractor must provide matching mechanical connections. PVC piping should not be used. Be sure that water inlet and outlet connections match certified drawings and nozzle markings.

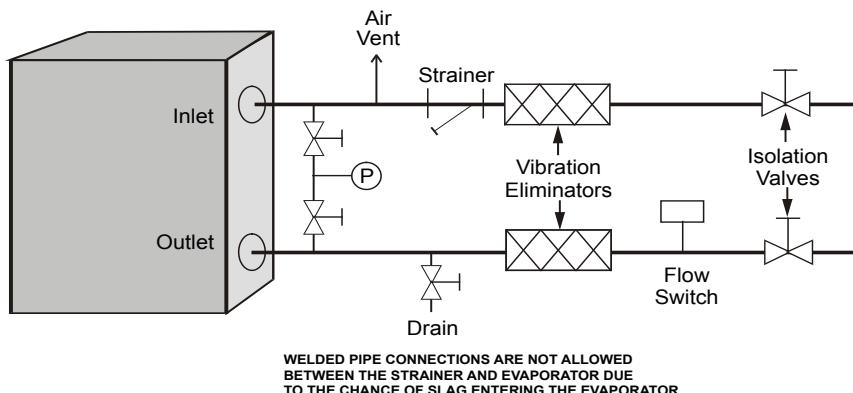

Field-installed water piping to the chiller **must** include:

- A cleanable strainer installed at the water inlet to the evaporator to remove debris and impurities before they reach the evaporator, causing damage. See the Inlet Strainer Guidelines and the current version of the product Installation, Operation and Maintenance manual on www.DaikinApplied.com for additional details.
- Adequate piping support to eliminate weight and strain on the fittings and connections.
- A water flow switch must be installed in the horizontal piping of the supply (evaporator outlet) water line to avoid evaporator freeze-up under low or no flow conditions. The flow switch is supplied by the factory as an installed component or a field-installed kit shipped along with the unit. (See page 49 for more information.)

- Piping for units with brazed-plate evaporators must have a drain and vent connection provided in the bottom of the lower connection pipe and to the top of the upper connection pipe respectively, see Figure 23. These evaporators do not have drain or vent connections due to their construction.

It is **recommended** that the field-installed water piping to the chiller include:

- Thermometers at the inlet and outlet connections of the evaporator.
- Water pressure gauge connection taps and gauges at the inlet and outlet connections of the evaporator for measuring water pressure drop.
- Vibration eliminators in both the supply and return water lines. Pressure gauges must be installed in the inlet and outlet water lines to the evaporator.
- Insulated chilled water piping to reduce heat loss and prevent condensation. For information on freeze protection, see "Evaporator Freeze Protection" on page 13.

Figure 23: Typical Piping, Brazed-Plate Evaporator

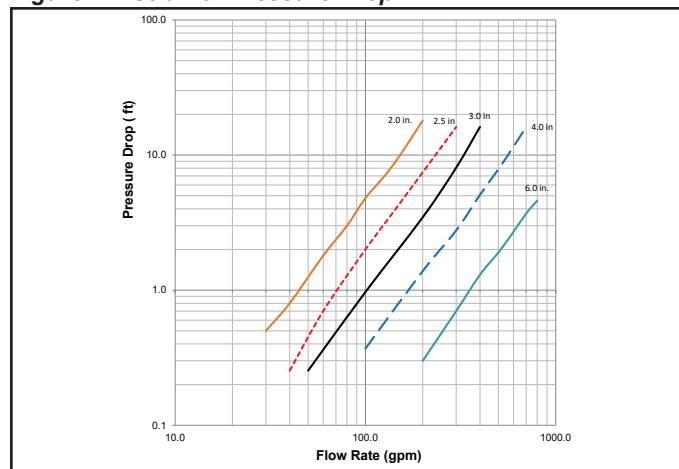

Inlet Strainer Guidelines

An inlet water strainer kit **must** be installed in the chilled water piping before the evaporator inlet. Several paths are available to meet this requirement:

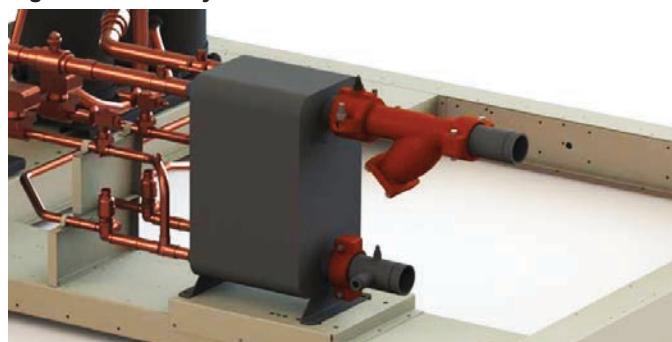

1. A factory installed option.
2. A field-installed kit shipped-loose with the unit that consists of:
 - Y-type area strainer with 304 stainless steel perforated basket, Victaulic pipe connections and strainer cap.
 - Extension pipe with two Schrader fittings that can be used for a pressure gauge and thermal dispersion flow switch. The pipe provides sufficient clearance from the evaporator for strainer basket removal.
 - 0.5-inch blowdown valve
 - Two grooved clamps

Both are sized per Table 2 and with the pressure drop shown in the Strainer Pressure Drop graph. Connection sizes are given in the physical data section beginning on page 25.

3. A field-supplied strainer that meets specification and installation requirements of the current Installation, Operation and Maintenance Manual available at www.DaikinApplied.com.

Figure 24: Strainer Pressure Drop**Table 2: Strainer Data**

Trailblazer™ Model	Strainer Size in (mm)	Maximum perforation size in (mm)	Factory Installed Option	Field Installed Option
030-071	2.5 (64)	0.063 (1.6)	Y	Y
075-130	3.0 (76)	0.063 (1.6)	Y	Y
140-180	4.0 (102)	0.063 (1.6)	Y	Y
191-241	6.0 (152)	0.063 (1.6)	Y	Y

Figure 25: Factory Installed Strainer

Water Flow Limitations

Constant Flow

The evaporator flow rates and pressure drops shown in Figure 30 on page 22 and Table 14 on page 23 are for full load design purposes. The maximum flow rate and pressure drop is based on a 6°F temperature drop. Flow rates above the maximum values will result in unacceptable temperature and pressure drops and can cause excessive erosion, potentially leading to failure.

The minimum flow and pressure drop is based on a full load evaporator temperature drop of 16°F. Evaporator flow rates below the minimum values can result in laminar flow causing freeze-up problems, scaling and poor control.

Variable Flow

Reducing evaporator flow in proportion to load can reduce system power consumption. The rate of flow change should be

a maximum of 10 percent of the flow per minute. For example, if the maximum design flow is 200 gpm and it will be reduced to a flow of 140 gpm, the change in flow is 60 gpm. Ten percent of 200 gpm equals 20 gpm change per minute, or a minimum of three minutes to go from maximum to desired flow. The water flow through the evaporator must remain between the minimum and maximum values listed in Table 14 on page 23. If flow drops below the minimum allowable, large reductions in heat transfer can occur. If the flow exceeds the maximum rate, excessive pressure drop and tube erosion can occur.

System Water Volume Considerations

All chilled water systems need adequate time to recognize a load change, respond to the change and stabilize to avoid undesirable short cycling of the compressors or loss of temperature control. In air conditioning systems, the potential for short cycling usually exists when the building load falls below the minimum chiller plant capacity or on close-coupled systems with very small water volumes. Some of the things the designer should consider when looking at water volume are the minimum cooling load, the minimum chiller plant capacity during the low load period and the desired cycle time for the compressors. Assuming that there are no sudden load changes and that the chiller plant has reasonable turndown, a rule of thumb of "gallons of water volume equal to two to three times the chilled water gpm flow rate" is often used. A storage tank may have to be added to the system to reach the recommended system volume.

Evaporator Freeze Protection

Evaporator freeze-up can be a concern in the application of air-cooled water chillers in areas experiencing below freezing temperatures. To protect against freeze-up, insulation and an electric heater are furnished with the evaporator. AGZ-E chillers have an external plate heater and thermostat that helps protect the evaporator down to -20°F (-29°C) ambient air temperature. Although the evaporator is equipped with freeze protection, it does not protect water piping external to the unit or the evaporator itself if there is a power failure or heater burnout, or if the chiller does not directly control the chilled water pumps. Use one of the following recommendations for additional protection:

1. If the unit will not be operated during the winter, drain evaporator and chilled water piping and flush with glycol.
2. Add a year-round glycol solution to the chilled water system to provide freeze protection. Freeze point should be approximately 10°F (5.6°C) below minimum design ambient temperature or 10°F below the lowest design leaving water temperature, whichever is lower. The use of glycol anti-freeze is generally considered the safest protection against freeze-up, however, it will reduce the performance of the unit, depending on the concentration. Take this into consideration during initial system design and selection. On glycol applications, a minimum fluid concentration should be based on Burst Protection limits.
3. The field installation of thermostatically controlled heat tracing and insulation to exposed piping. Factory insulation will have to be removed and replaced after installation of the tracing.

4. Continuous circulation of water through the chilled water piping and evaporator. (Dependent on power availability).

The evaporator heater cable or immersion heater is factory wired to the 115 volt circuit in the control box. This power should be supplied from a separate source to maximize unit protection, but it can be supplied from the control circuit. Operation of the heaters is automatic through the ambient sensing thermostat that energizes the evaporator heaters for protection against freezing. Unless the evaporator is drained in the winter or contains an adequate concentration of anti-freeze, the disconnect switch to the evaporator heater must be closed. Conversely, do not apply heat to the evaporator if it is drained.

Chilled Water Pump

It is important that the chilled water pumps be wired to, and controlled by, the chiller's microprocessor. The chiller controller has the capability to selectively send the signal to a pump relay (by others) to start pump A or B or automatically alternate pump selection and also has standby operation capability. The controller will energize the pump whenever at least one circuit on the chiller is enabled to run, whether there is a call for cooling or not. This helps ensure proper unit start-up sequence. The pump will also be turned on when the water temperature remains equal to or goes below the Freeze Setpoint for longer than a specified time to help prevent evaporator freeze-up. Connection points are shown in the Field Wiring Diagram on page 45 and page 46.

CAUTION

Adding glycol or draining the system is the recommended method of freeze protection. If the chiller does not have the ability to control the pumps and the water system is not drained in temperatures below freezing, catastrophic evaporator failure may occur.

Failure to allow pump control by the chiller may cause the following problems:

1. If any device other than the chiller attempts to start the chiller without first starting the pump, the chiller will lock out on the No Flow alarm and require manual reset.
2. If the chiller evaporator water temperature drops below the "Freeze setpoint" the chiller will attempt to start the water pumps to avoid evaporator freeze. If the chiller does not have the ability to start the pumps, the chiller will alarm due to lack of water flow.
3. If the chiller does not have the ability to control the pumps and the water system is not drained in temperatures below freezing, the chiller may be subject to catastrophic evaporator failure due to freezing. The freeze rating of the evaporator is based on the immersion heater and pump operation. The immersion heater itself may not be able to properly protect the evaporator from freezing without circulation of water.

High Ambient Operation

Trailblazer® units for high ambient operation (105°F to 125°F, 40°C to 52°C) require the addition of the optional high ambient package that includes a small fan with a filter in the air intake to cool the control panel. All units with the optional VFD low ambient fan control include the high ambient option.

Low Ambient Operation

Compressor staging is adaptively determined by system load, ambient air temperature, and other inputs to the MicroTech® III control. The standard minimum ambient temperature is 32°F (0°C). A low ambient option with fan VFD allows operation down to -10°F (-23°C). The minimum ambient temperature is based on still conditions where the wind is not greater than 5 mph. Greater wind velocities will result in reduced discharge pressure, increasing the minimum operating ambient temperature. Field-installed louvers are available and recommended to help allow the chiller to operate effectively down to the ambient temperature for which it was designed.

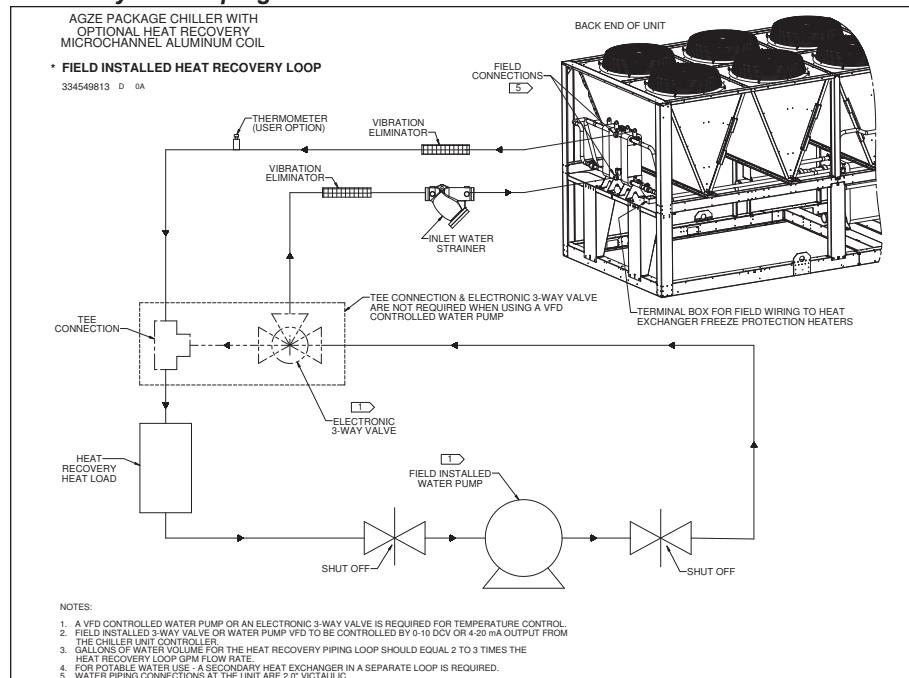

Partial Heat Recovery

Partial heat recovery for Trailblazer® chillers is achieved by adding an auxiliary heat exchanger in each unit refrigerant circuit between the compressors and the condenser coils. The heat exchangers transfer the heat from the compressor discharge gas to a separate water loop which can be used for various heating applications. The heating recovery cycle is only available when the chiller is running. The partial heat recovery auxiliary heat exchanger can return water up to 155°F; however, this value cannot be set. The amount of heat produced can be up to 50% of the nominal cooling capacity and is dependent on the requested cooling load, the operating temperatures, and the water flow rate through the auxiliary heat exchangers. Please note, if potable water is desired, a secondary heat exchanger in a separate water loop must be used. Contact your local Daikin Applied for information on specific applications.

Partial heat recovery components that are factory-supplied:

- Brazed plate heat exchangers - one in each circuit with the water piped together in parallel for one inlet and one outlet water connection, see Figure 31 for pressure drops.

Figure 26: Partial Heat Recovery Field Piping Schematic

- Insulation of heat exchangers and water piping at the unit.
- Separate temperature sensors for inlet and outlet water piping at the heat exchangers.
- Connections for air vent at the outlet water piping and drain at the inlet water piping.
- Immersion heater for each auxiliary heat exchanger for freeze protection.

Required partial heat recovery field piping (see Figure 26) and connections (see page 47) are listed below.

- An external 3-way valve or a variable speed pump in the auxiliary heat exchanger water piping for modulation of flow through the heat exchangers by the unit controller. Heat recovery water loop pump must also be controlled by the chiller controller.
- A cleanable strainer with perforations no larger than 0.063" (1.6 mm) diameter must be installed within 5 feet (1500 mm) of pipe length from the heat exchanger inlet and downstream of any welded connections, see Figure 24 for pressure drop.
- Water piping and other portions of the heat recovery water loop must be insulated to prevent heat loss and possible injury due to hot surfaces.
- A field-installed safety or relief valve on the water side is required to prevent risks in case the water temperature thermostat should fail.
- Separate 120 volt power supply for immersion heaters. A junction box for a 120 Volt power connection is provided.
- A water tank and an additional water heater is suggested in the heat recovery piping loop for initial water temperature control and better loop stability. Typical loop sizing guidance is water volume (in gallons) be greater than or equal to two to three times the heat recovery water flow rate (in gallons/minute).

Condenser Coil Options and Coating Considerations

The standard coils on the Trailblazer® chiller are an all aluminum alloy microchannel design with a series of flat tubes containing multiple, parallel flow microchannels layered between the refrigerant manifolds. The microchannel coils are designed to withstand 1000+ hour acidified synthetic sea water fog (SWAAT) test (ASTM G85-02) at 120°F (49°C) with 0% fin loss and develop no leaks. The all-aluminum microchannel coils provide superior longevity and durability for non-corrosive applications.

Table 3: Coil/Coating Selection Matrix

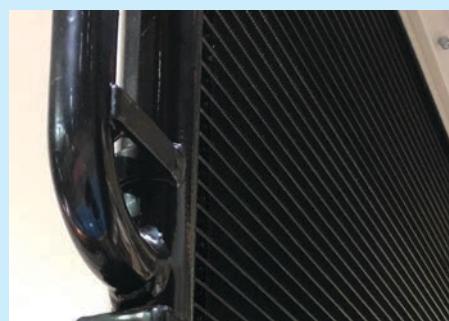

Coil Option	Non-Corrosive ¹	Unpolluted Marine ²	Industrial ³	Combined Marine-Industrial ⁴
Standard Microchannel	+++	-	-	-
Epoxy-coated	+++	+++	+++	++

NOTE:

1. Non-corrosive environments may be estimated by the appearance of existing equipment in the immediate area where the chiller is to be placed.
2. Marine environments should take into consideration proximity to the shore as well as prevailing wind direction.
3. Industrial contaminants may be general or localized, based on the immediate source of contamination (i.e. diesel fumes due to proximity to a loading dock).
4. Combined marine-industrial are influenced by proximity to shore, prevailing winds, general and local sources of contamination.

Epoxy coil coating is a water-based, extremely flexible and durable epoxy polymer coating uniformly applied to all coil surfaces through a multi-step, submerged electrostatic coating process. Epoxy-coated condenser coils provide a 10,000+ hour salt spray resistance per ASTM B117-90. The epoxy-coated coils also receive a UV-resistant urethane top-coat to provide superior resistance to degradation from direct sunlight. This coil coating option provides the best overall protection against corrosive marine, industrial or combined atmospheric contamination.

Figure 27: Epoxy Coil Coating

Background Information

Sound levels can be as important as unit cost and efficiency. The inherently quiet scroll compressors used in Trailblazer® chillers are coupled with precision engineering for industry-leading sound levels.

AHRI has established standards to provide uniform methods for the determination of the sound levels of equipment. For large air-cooled chillers, it is AHRI Standard 370, "Sound Ratings of Large Outdoor Refrigeration and Air-Conditioning Equipment." Data contained in this section are in accordance with this standard.

"A" Weighting

Sound values may be represented several ways. One of the more common forms is the "A" weighted value, which adds or subtracts a specific amount to each center band frequency, then logarithmically adds the values to establish a single value. The "A" scale is used to represent how the human ear receives sound. The amount added in each frequency band directly corresponds to how sensitive the human ear is to each frequency.

Table 4: "A" Scale Relative Response to Human Ear

	Frequency, f, in Hz									
	31.5	63	125	250	500	1K	2K	4K	8K	16K
dB(A)	-39.4	-26.2	-16.1	-8.6	-3.2	0	+1.2	+1.0	-1.1	-6.6

Sound Pressure Levels - Full Load

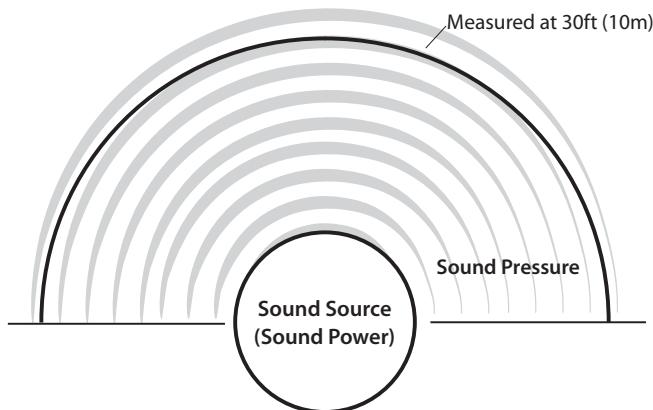

Sound pressure is the sound level that can be measured at some distance from the source. Sound pressure varies with distance from the source and depends on the surroundings. For example, a brick wall (a reflective surface) located 10 feet from a unit will affect the sound pressure measurements differently than a brick wall at 20 feet. Sound pressure is measured in decibels (dB).

All sound pressure data in the following pages are considered typical of what can be measured in a free field with a handheld sound meter, in the absence of any nearby reflective surfaces except the floor under the unit. Sound pressure levels are measured at 30 feet (10 meters) from the side of the unit at 100% load and standard AHRI conditions (per AHRI standard 550/590) of 95°F (35°C) ambient air temperature and 44°F (7°C) leaving evaporator water temperatures for air-cooled units.

Sound Power Levels

Sound power is a calculated quantity and cannot be measured directly like sound pressure. Sound power is not dependent on the surrounding environment or distance from the source, as is sound pressure. It can be thought of as basic sound level emanating from the unit without consideration of distance or obstructions. Measurements are taken over a prescribed area around the unit and the data is mathematically calculated to give the sound power, dB. Acoustical consultants sometimes use sound power octave band data to perform a detailed acoustical analysis.

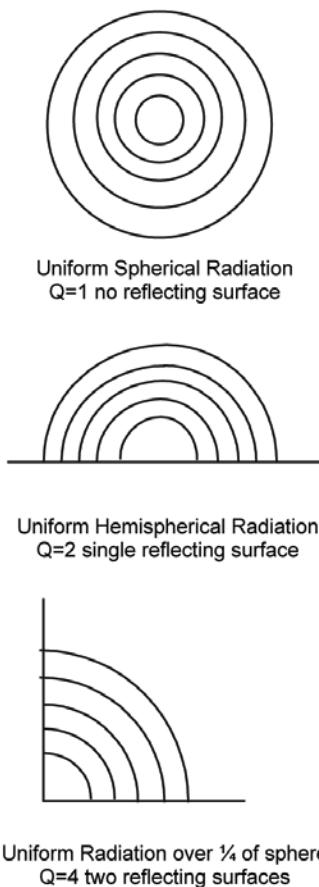

Figure 28: Sound Power vs. Sound Pressure

The data in Table 6 on page 18 and Table 10 on page 20 present sound power levels per AHRI Standard 370, "Sound Rating of Large Outdoor Refrigerating and Air Conditioning Equipment". This standard was developed to establish uniform methods of determining the sound power radiated by large outdoor equipment. Measurements are taken over a prescribed area around the unit and the data is mathematically calculated to give the sound power, dB.

Sound Reduction due to Distance from the Unit

The distance between a source of sound and the location of the sound measurement plays an important role in minimizing sound problems. Sound pressure can be calculated at any distance from the unit if sound power and "Q," the directivity factor, are known. "Q" is a dimensionless number that compensates for the type of sound reflection from the source. For example, a unit sitting on a flat roof or ground with no other reflective surfaces or attenuation due to grass, snow, etc., between source and receiver will have Q=2. See Figure 29 for definitions of Q=1, Q=2, and Q=4.

Figure 29: "Q" Reflective Sources Illustration

Once sound power and "Q" are known, sound pressure at any distance from the unit can be calculated using the following equation:

$$L_p = L_w - (20 \log r) + (10 \log Q) - 0.5$$

Where:

L_p = sound pressure

L_w = sound power

r = distance from unit in feet

Q = directionality factor

With $Q=1$, Unit suspended in space (theoretical condition), the equation simplifies to:

$$L_p = L_w - (20 \log r) - 0.5$$

With $Q=2$, for a unit sitting on a flat roof or ground with no adjacent vertical wall as a reflective surface, the equation simplifies to:

$$L_p = L_w - (20 \log r) + 2.5$$

With $Q=4$ for a unit sitting on a flat roof or ground with one adjacent vertical wall as a reflective surface, the equation simplifies to:

$$L_p = L_w - (20 \log r) + 5.5$$

Results for typical distances and the two most usual cases of "Q" are tabulated in Table 5.

Table 5: dB Conversion of Sound Power to Pressure

Distance from Sound Source ft (m)	DB Reduction from Sound Power at the Source to Sound Pressure at Referenced Distance	
	Q=2	Q=4
30 (9)	27.1	24.0
50 (15)	31.6	28.5
75 (23)	35.1	32.0
100 (30)	37.6	34.5
150 (46)	41.1	38.0
200 (61)	43.6	40.5
300 (91)	47.6	44.0

Sound Data Notes

When referencing sound data below, please note:

1. Octave band readings are flat dB, overall is A-weighted.
2. Sound pressure data taken at 30 feet (9 meters) from side of unit.
3. Q=2, unit on flat surface with no adjacent wall.

All High Efficiency Trailblazer® models with fully variable speed fans also include a sound reduction mode to allow for reduced-sound operation. Based on a user-settable time schedule, the chiller will enter the reduced noise mode, which will limit the speed of the condenser fans in order to reduce sound levels. This feature is especially helpful in areas that have more stringent sound restrictions during certain times of day. While the lower fan speed may have a slight impact on the maximum unit capacity during hot outdoor conditions, the chiller can be set to automatically override the fan speed restrictions if additional capacity is needed. This way, the unit will always optimize between required capacity and the lowest sound level possible.

NOTE: 1. Full load flow minimum is the minimum allowable flow at full load conditions, and/or for a constant flow system.

2. Part Load flow minimum is the minimum allowable flow for a partially loaded unit, which is only applicable a variable flow system.

Flow may only be reduced proportionally to load, i.e. a flow reduction of 25% from the design flow rate is only allowable if the chiller load is reduced by 25%.

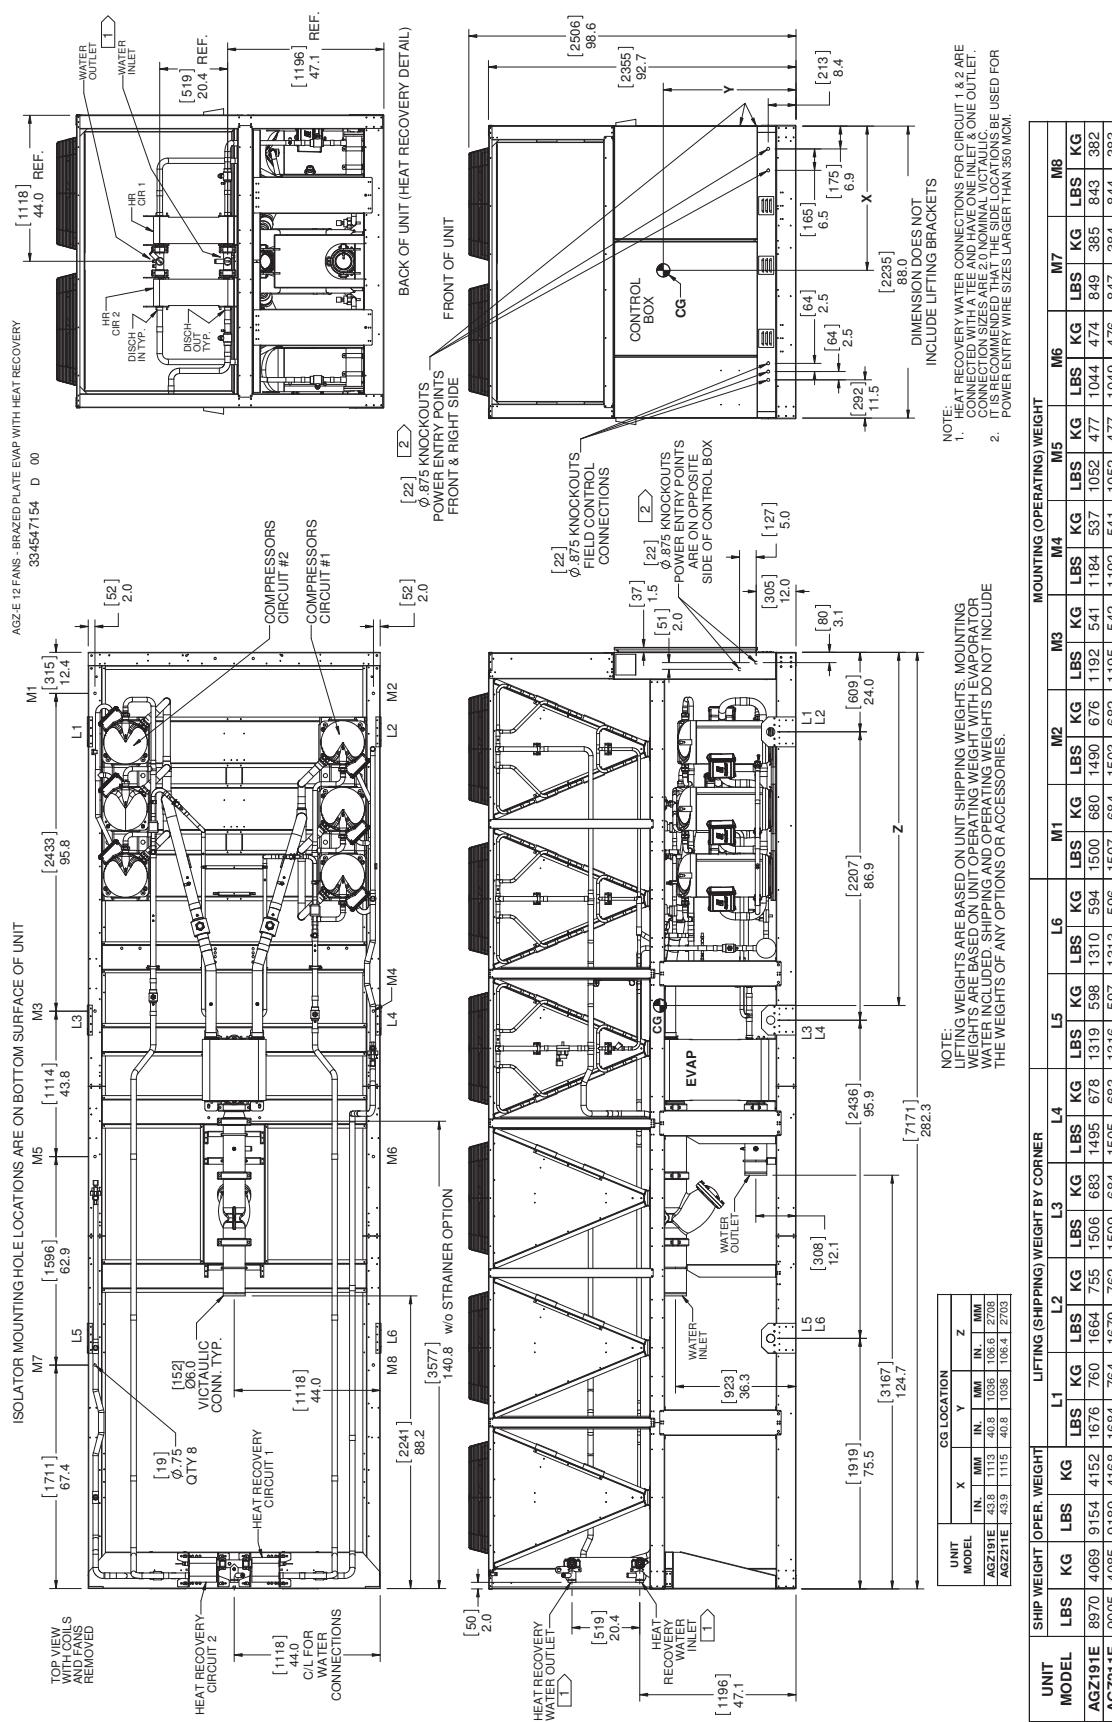

Figure 46: AGZ226E - AGZ241E - Heat Recovery Option

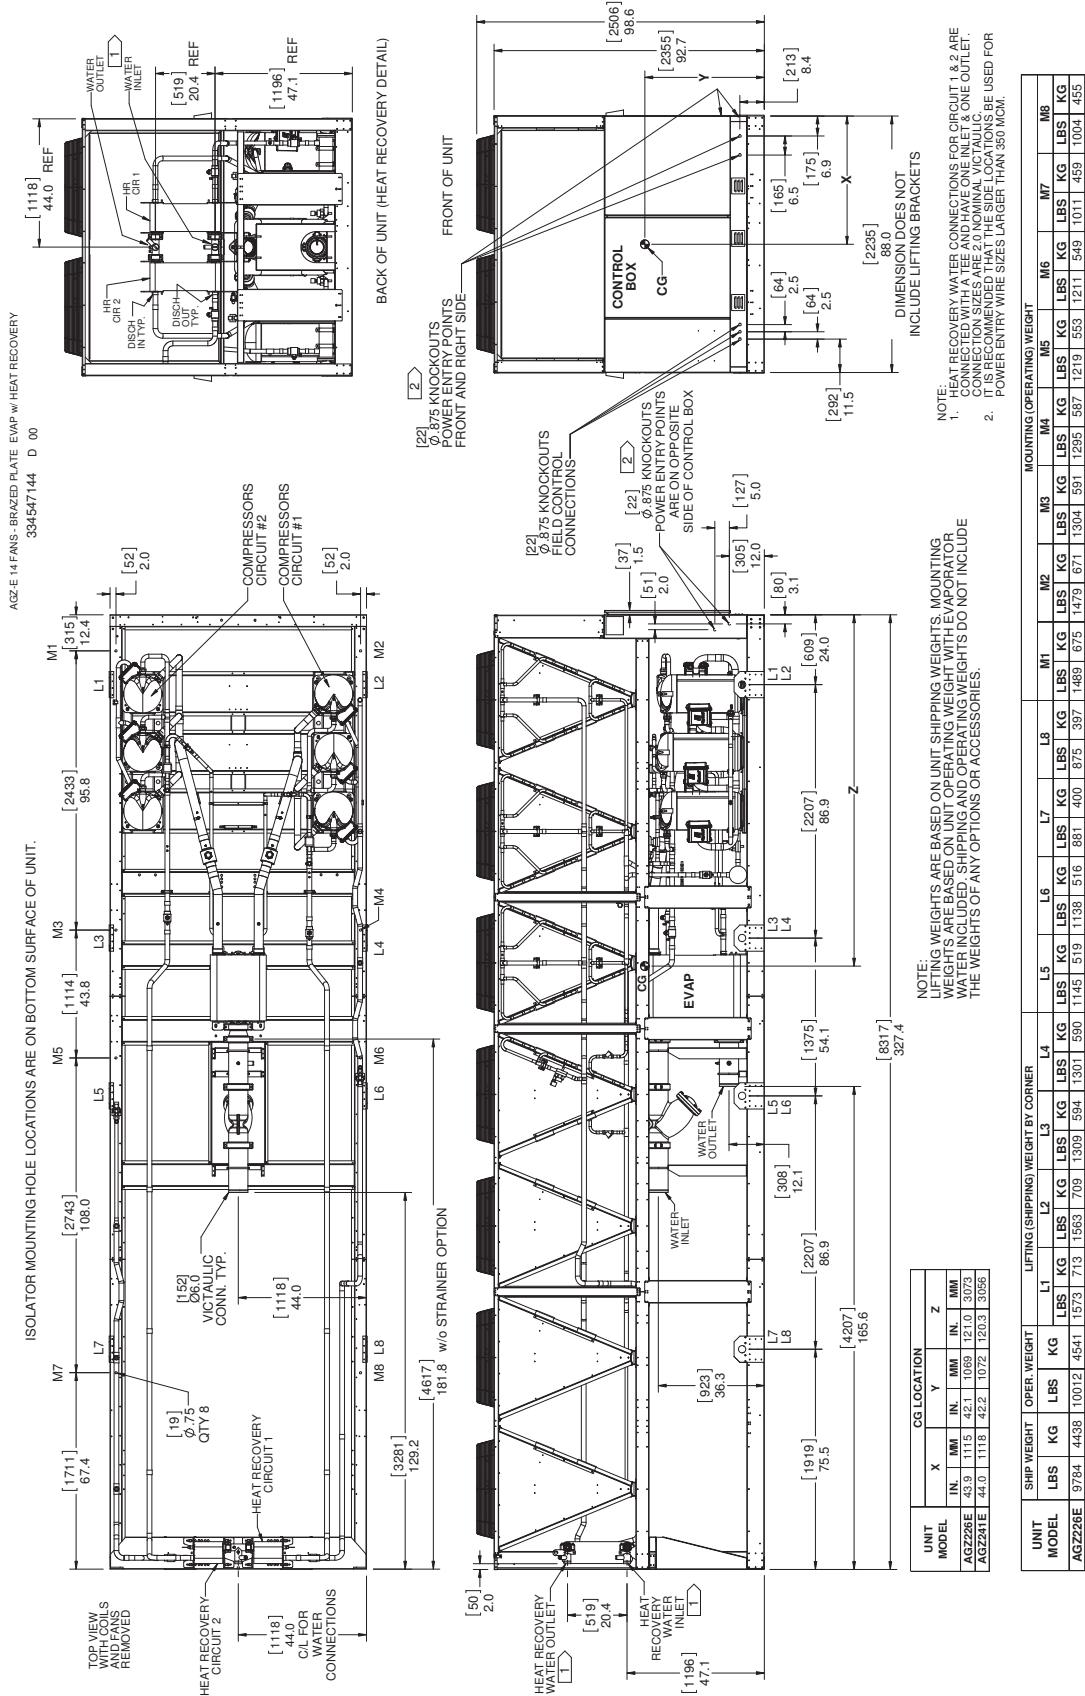

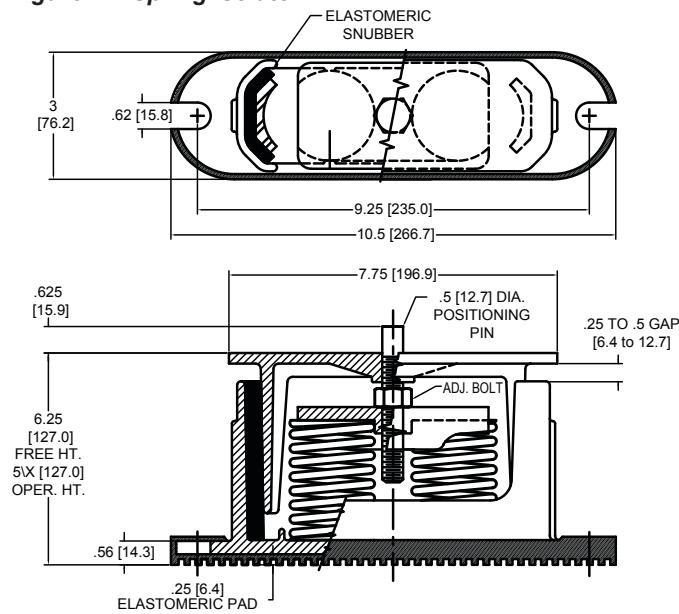

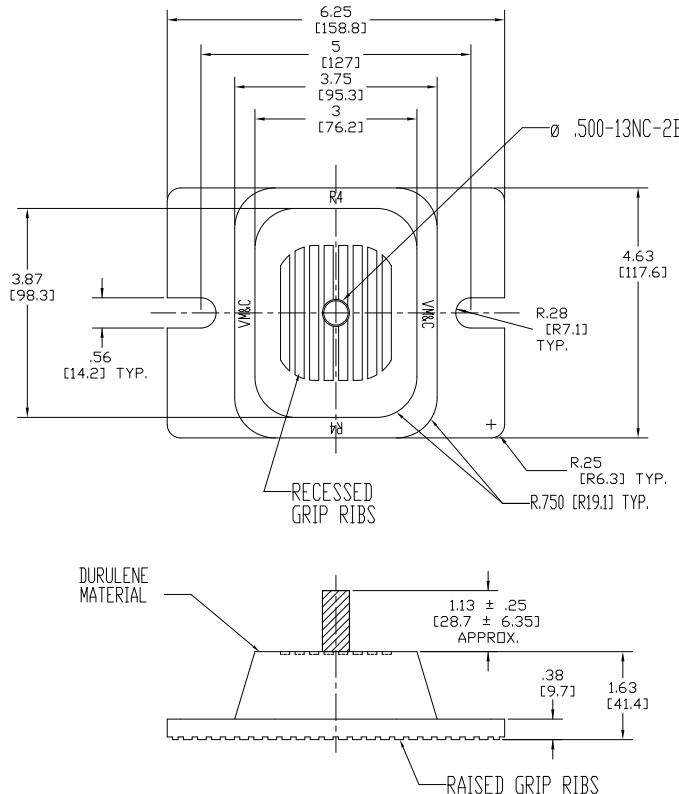

Figure 47: Spring Isolator**Figure 48: Rubber-in-Shear (RIS) Isolator**

Transfer the unit as indicated in the current AGZ-E Installation and Operation Manual, which can be found on www.DaikinApplied.com.

In all cases, set the unit in place and level. If anti-skid pads are used, do not use hold down bolts. If hold down bolts are used, do not use anti-skid pads.

When spring isolators are required, install springs running under the main unit supports. Unit should be installed on blocks or shims at the listed free height. Isolator springs should not be loaded until the installation is complete, then adjust the springs to the vendor listed compression gap for the load point. When securing the isolator, do not over-tighten the mounting bolts. Over-tightening may result in cracking of the cast isolator housing and will have a negative impact on the isolation effect.

Installation of spring isolators requires flexible piping connections and at least three feet of flexible electrical conduit to avoid straining the piping and transmitting vibration and noise.

Mounting locations for each model can be found in the Dimensions and Weights section, starting on page 29.

Neoprene waffle pads, supplied by customers, should be mounted at the defined mounting point locations along the rail length.

DANGER

LOCKOUT/TAGOUT all power sources prior to starting, pressurizing, de-pressuring, or powering down the Chiller. Failure to follow this warning exactly can result in serious injury or death. Disconnect electrical power before servicing the equipment. More than one disconnect may be required to deenergize the unit. Be sure to read and understand the installation, operation, and service instructions within product manual.

Electrical Data Notes

1. Power wiring connections to the chiller may be done with either copper or aluminum wiring. Wire should be sized per NEC and/or local codes. Wire sizing and wire count must fit in the power connection lug sizing shown in the unit submittals.
2. The control transformer is furnished and no separate 115V power is required. For both single and multi-point power connections, the control transformer is in circuit #1 with control power wired from there to circuit #2. In multi-point power, disconnecting power to circuit #1 disconnects control power to the unit.
3. Wire sizing amps is 15 amps if a separate 115V power supply is used for the control circuit.
4. Single-point power supply requires a single disconnect to supply electrical power to the unit. This power supply must either be fused or use a circuit breaker.
5. All field wire lug range values given in the unit submittals apply to 75°C rated wire per NEC.
6. Must be electrically grounded according to national and local electrical codes.

DANGER

Qualified, licensed electricians must perform wiring. Electrical shock hazard exists that can cause severe injury or death.

Circuit Breakers

Factory-installed compressor circuit breakers are standard on units with single point power supply only. This option provides compressor short circuit protection and makes servicing easier.

Voltage Limitations:

1. Within 10% of nameplate rating.
2. Voltage unbalance not to exceed 2% with a resultant current unbalance of 6 to 10 times the voltage unbalance per NEMA MG-1, 2009 Standard Rev. 1-2010.

Table 24: Standard and HSCCR Panel Ratings

Panel Type	208V / 230V	380V / 400V / 460V	575V
Standard	5kA	5kA	5kA
HSCCR	65kA	65kA	25kA

Electrical Control Center

Operating and equipment protection controls and motor starting components are separately housed in a centrally located, weather-resistant control panel with hinged and tool-locked doors. In addition to the MicroTech® III controller described in the next sections, the following components are housed in the panel:

- Power terminal blocks, multi-point connection standard
- Control, input, and output terminal block
- Control transformer
- Optional disconnect switch (through-the-door handle)
- Compressor motor inherent thermal and overload protection is standard
- Optional phase voltage monitor with under/over voltage and phase reversal protection
- Fan contactors with short circuit protective devices.
- Optional ground fault protection
- FanTrol® fan staging head pressure control system
- Power connections are per [Table 25](#)

Power Connections

Table 25: Power Connection Availability

Power Connection	Power Block	Disc. Swt.	Comp. Circuit Breakers	Panel High Short Circuit Current Rating
Optional Single Point	Std.	Opt.	Std.	Opt.
Standard Multi-Point	Std.	Opt.	Not Avail.	Not Avail.

Definitions:

1. **Power Block:** An electrical device to directly accept field wiring without any disconnecting means.
2. **Disconnect Switch:** A molded case switch that accepts field wiring and disconnects main power to the entire unit or each main power supply if the multi-point power supply option is selected. This option does not provide overcurrent protection.
3. **Compressor Circuit Breakers:** A manually reset circuit breaker for each compressor, providing compressor only short circuit protection and located ahead of the contactor.
4. **Control Panel High Short Circuit Current Rating:** (Previously known as “withstand rating”). The entire control panel is designed for short circuit current rating as shown in [Table 24](#). In the event of a short circuit, the damage is contained within the control panel enclosure.

Figure 49: Typical Field Wiring Diagram (Single-Point Connection)

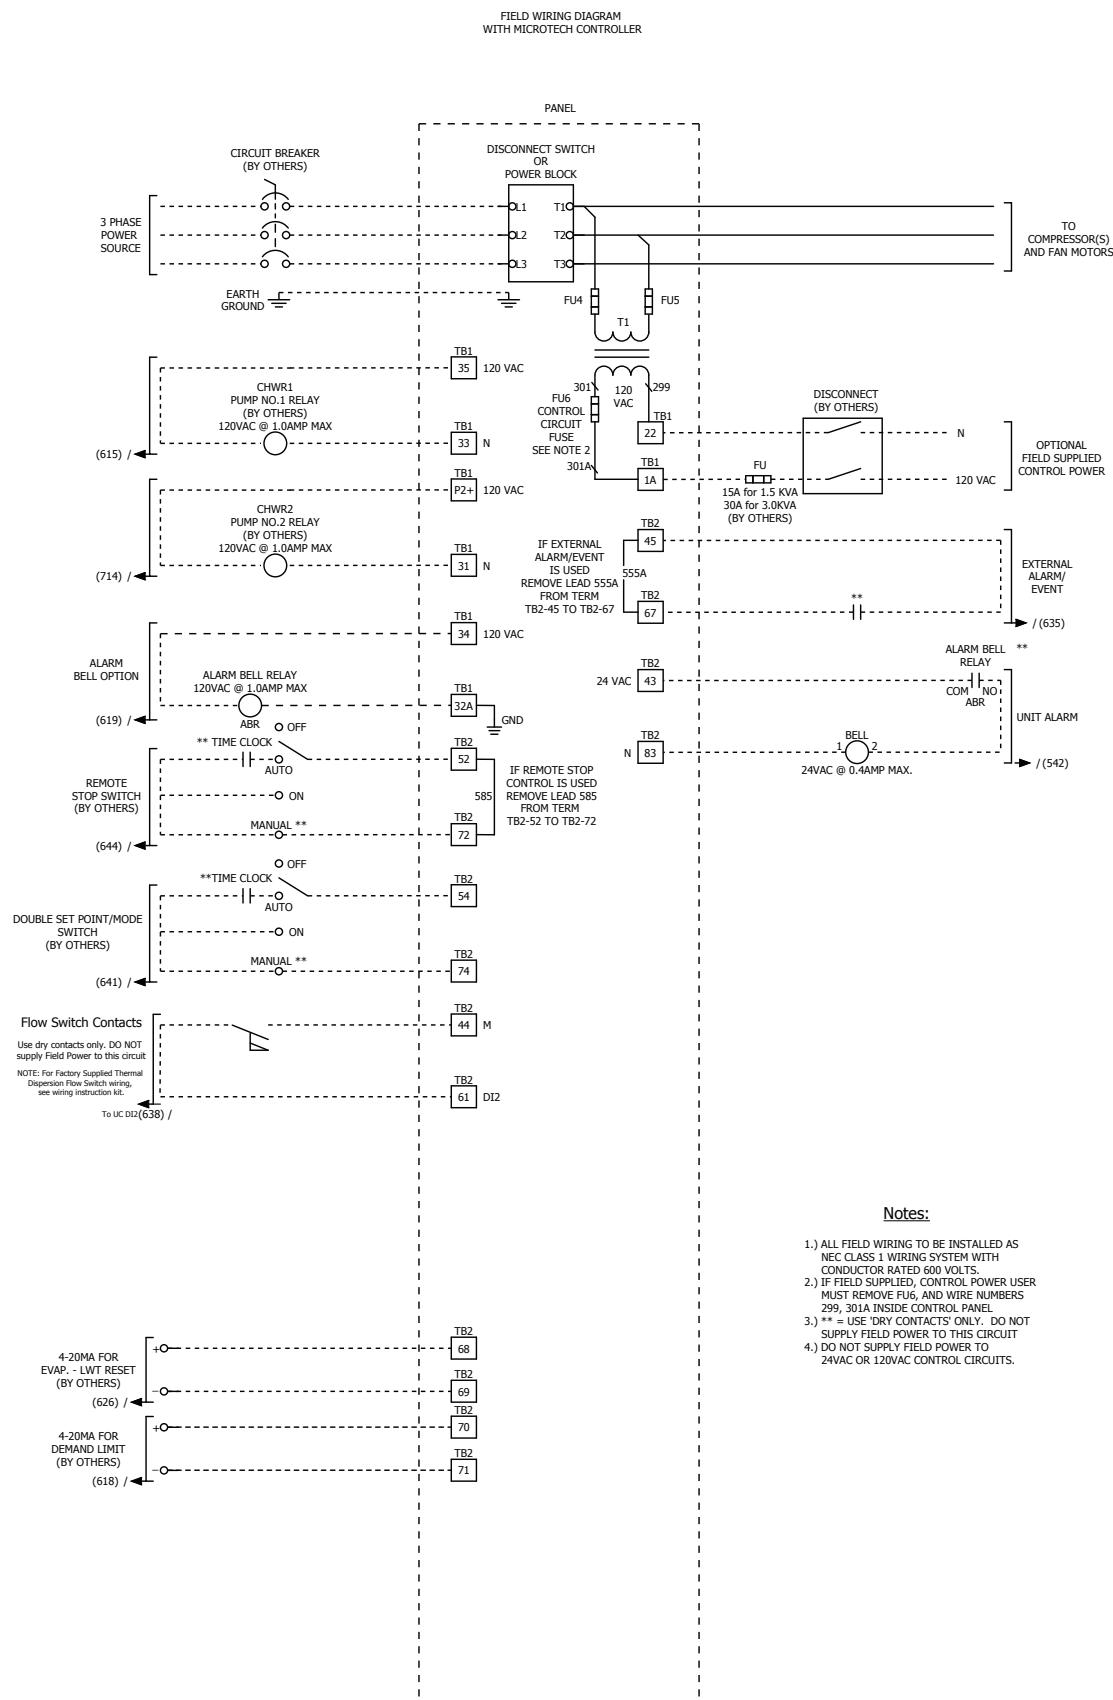

Figure 50: Typical Field Wiring Diagram (Multi-Point Connection)

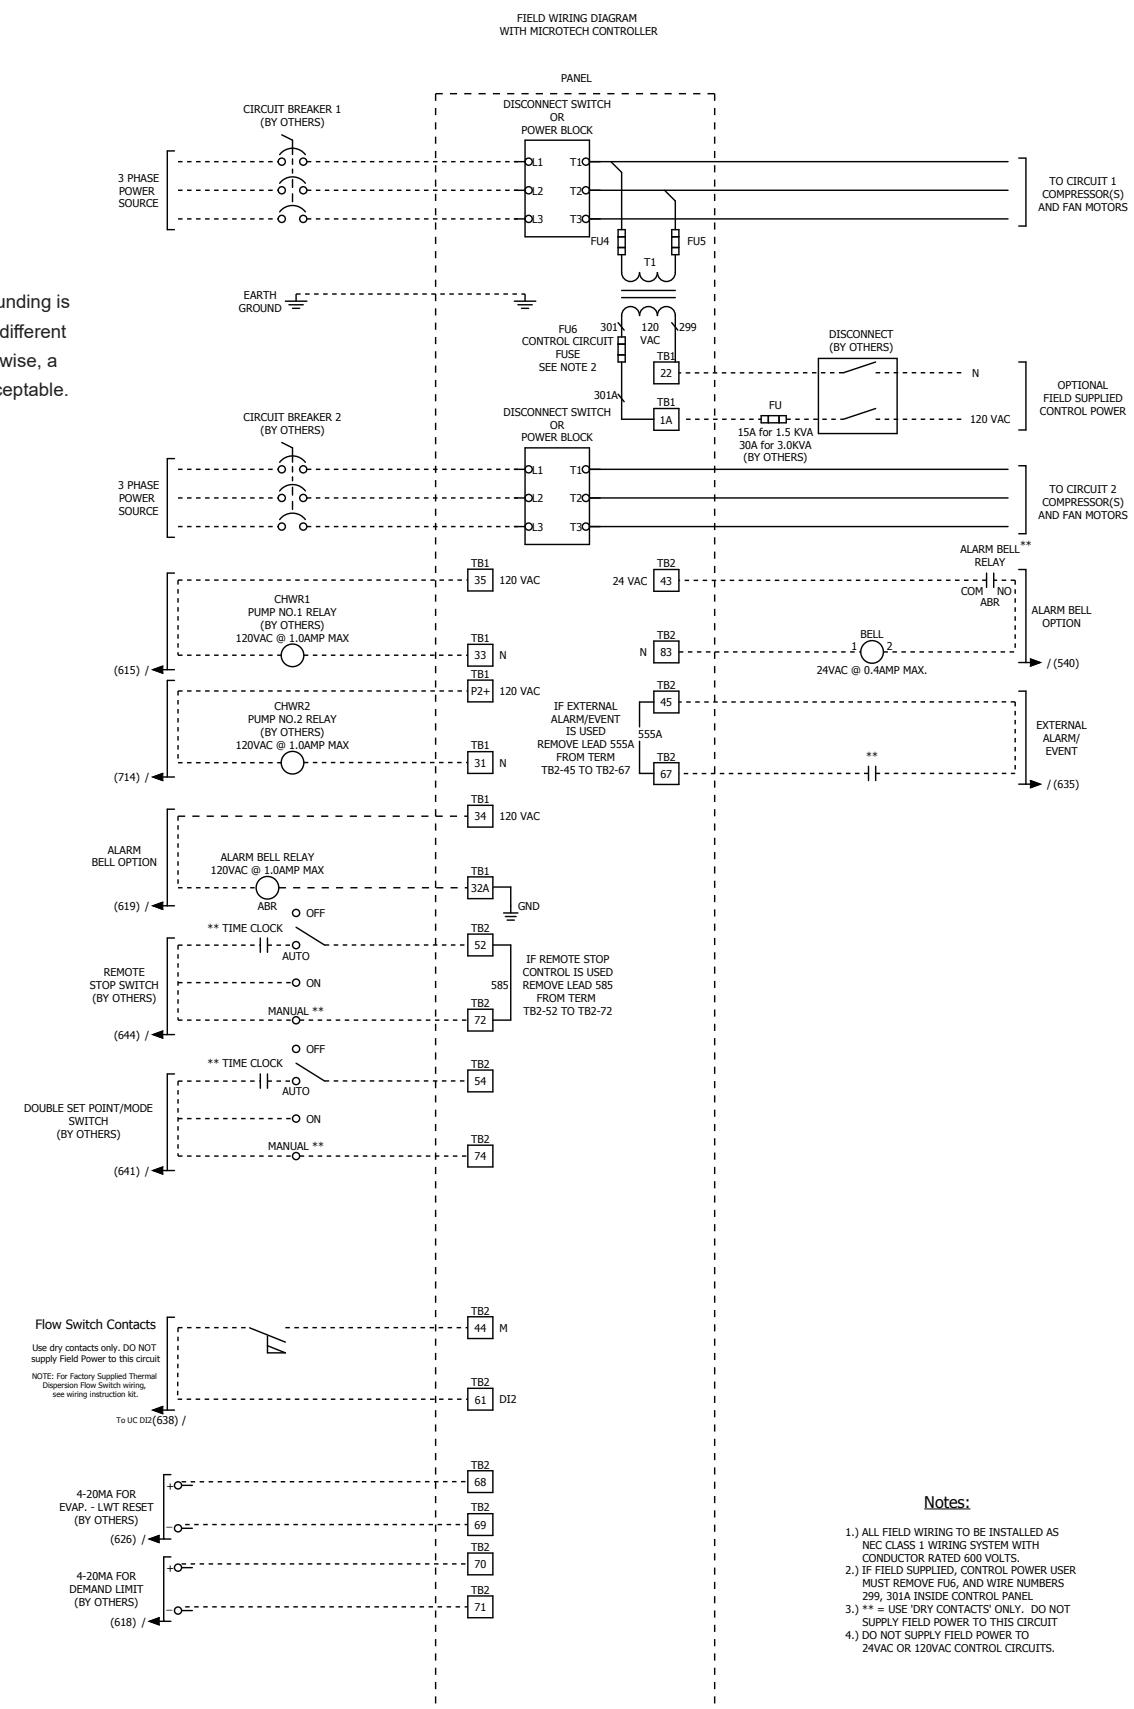

Figure 51: Typical Field Wiring Diagram for Partial Heat Recovery (Single-Point Connection)

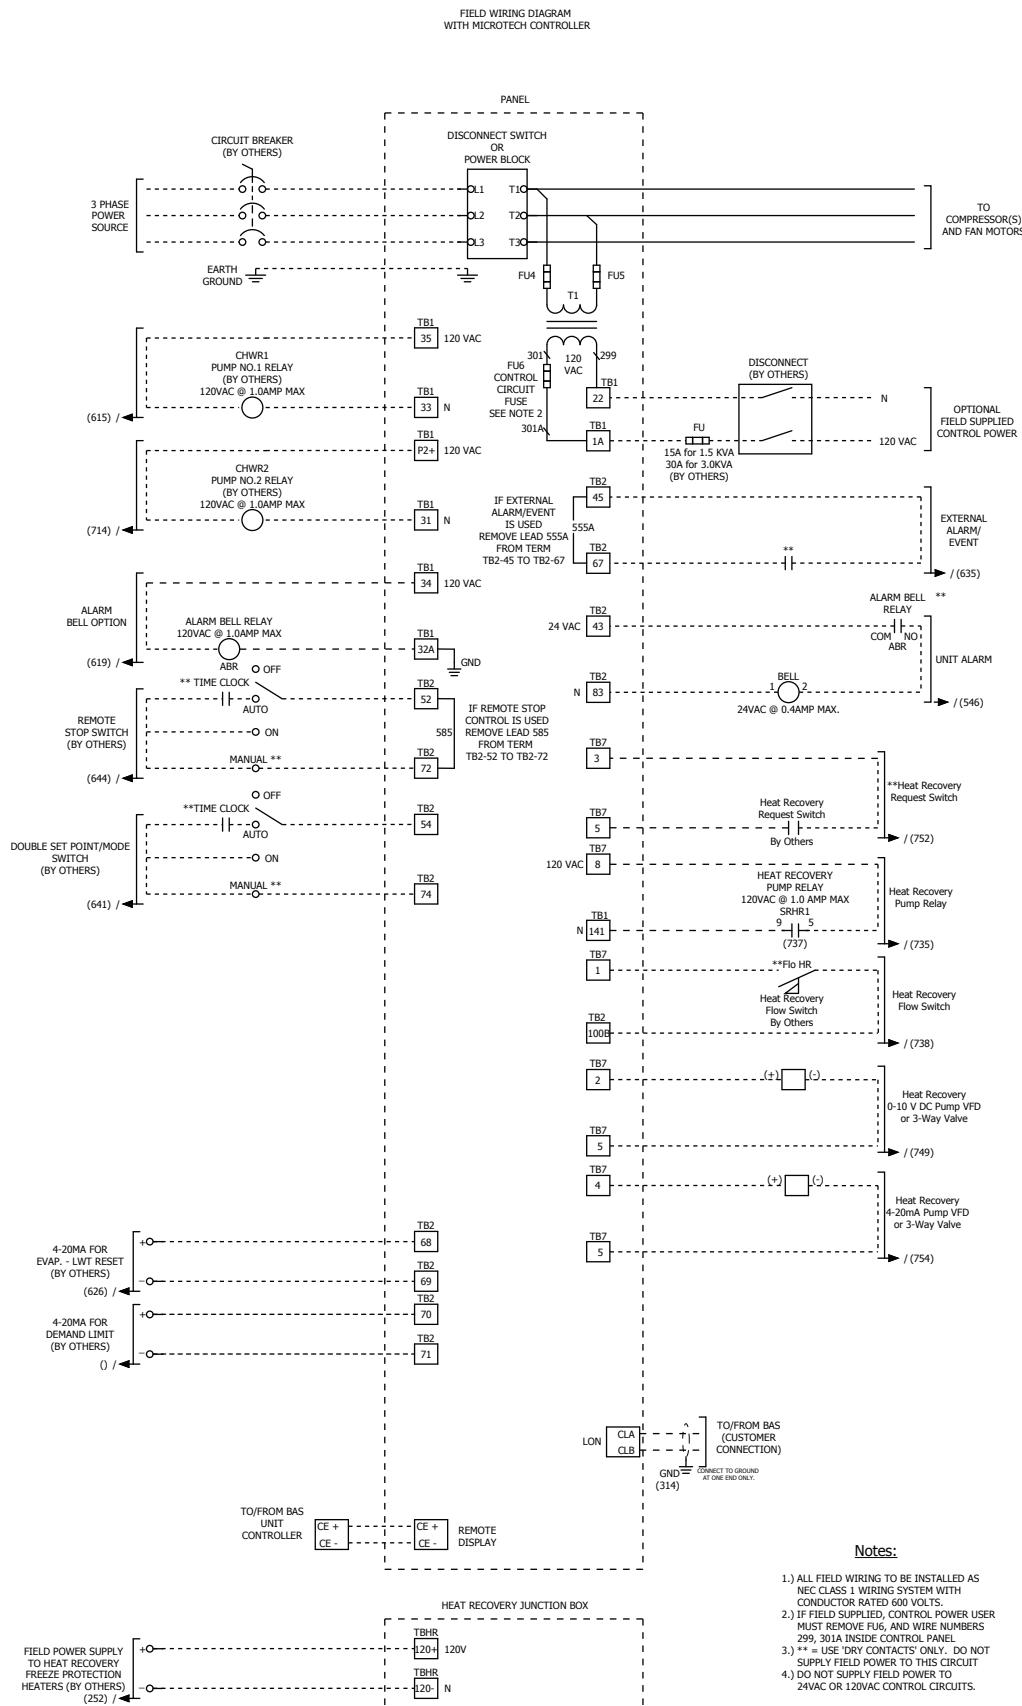

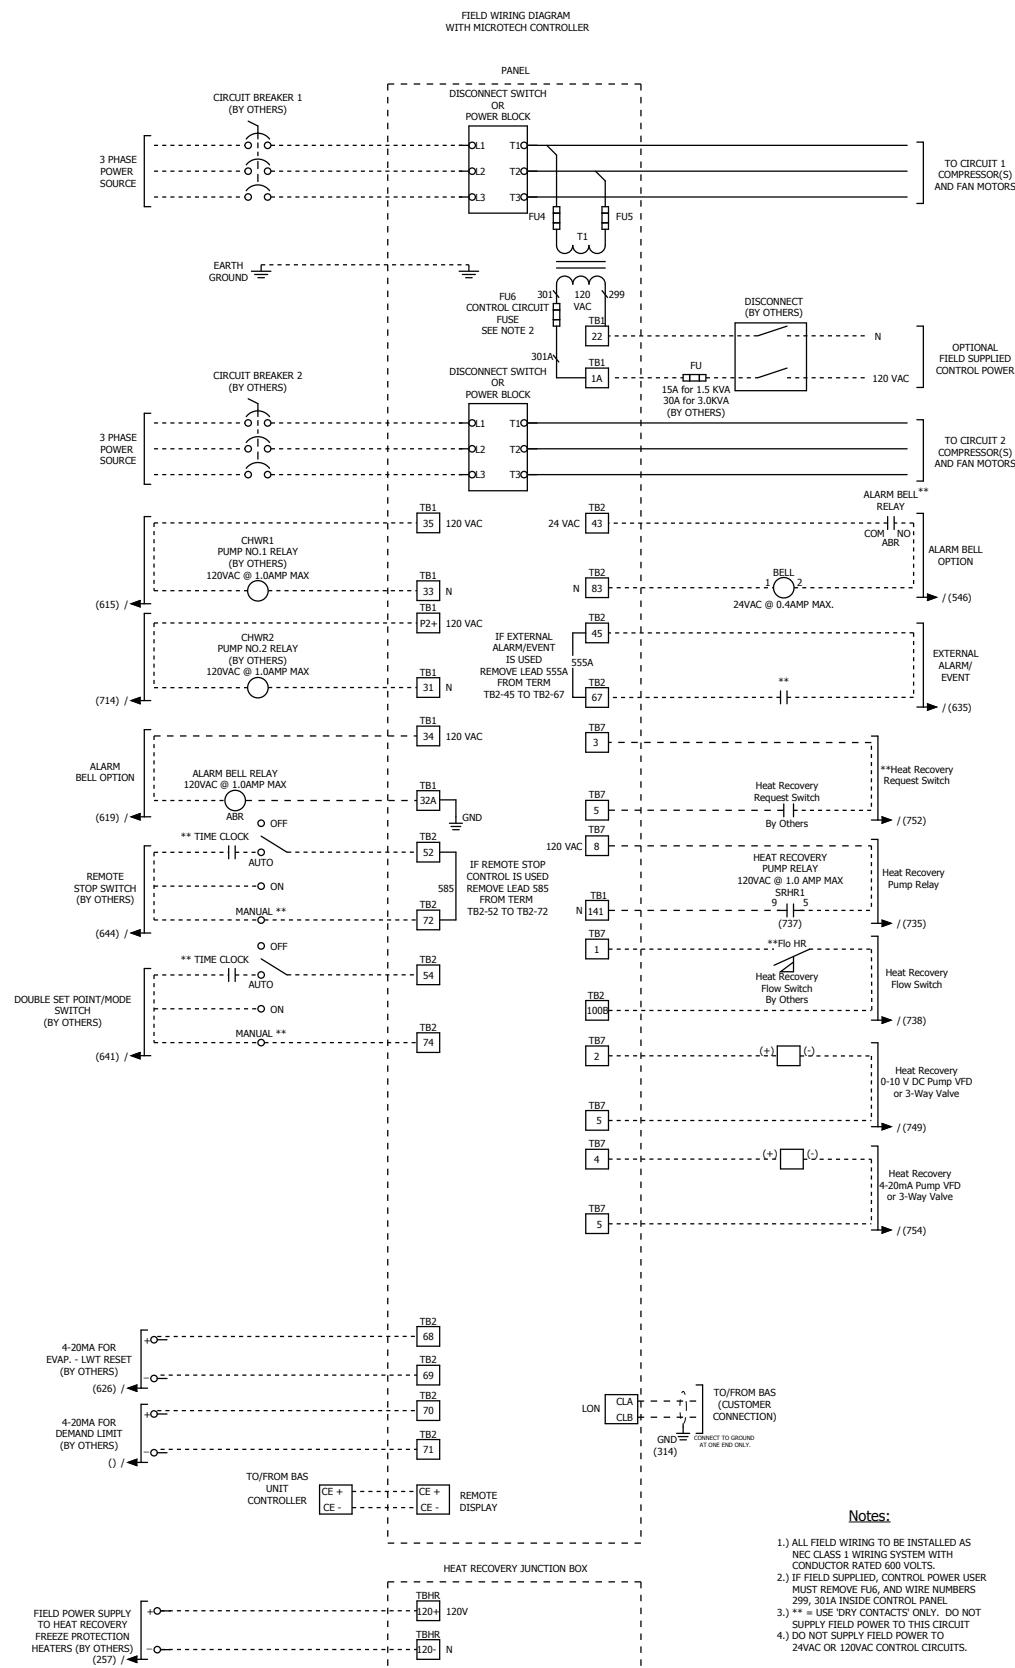

Figure 52: Typical Field Wiring Diagram for Partial Heat Recovery (Multi-Point Connection)

**Notes:**

- 1.) ALL FIELD WIRING TO BE INSTALLED AS NEC CLASS 1 WIRING SYSTEM WITH CONDUCTOR RATED 600 VOLTS.
- 2.) IF FIELD SUPPLIED, CONTROL POWER USER PROVIDED BY OTHERS. FUSES 301A AND 299, 301A INSIDE CONTROL PANEL.
- 3.) ** = USE 'DRY CONTACTS' ONLY. DO NOT SUPPLY FIELD POWER TO THIS CIRCUIT.
- 4.) DO NOT SUPPLY FIELD POWER TO 24VAC OR 120VAC CONTROL CIRCUITS.

Controls Options & Accessories

RapidRestore® and Fast Loading

Allows the unit to restart and to reach full load more quickly than standard in case of a power interruption. After a power loss duration of up to 180 seconds, once power is restored, the time for a Trailblazer® chiller to restart is less than 125 seconds with the chiller reaching full load within 220 seconds from power restoration.

Fast Loading Stand-By Chiller

Gives the system greater response time by starting a stand-by chiller and reaching full load capacity in 115 seconds (assumes conditions require full load capacity).

Hot Gas Bypass (Factory Installed)

Hot gas bypass permits unit operation down to 10% of full load capacity. This option includes a factory-mounted hot gas bypass valve, solenoid valve, and manual shutoff valve (models 075-241 only) for each circuit.

High Efficiency Variable Speed Condenser Fans

High efficiency adds variable speed drives to the condenser fans on the chiller. The MicroTech® III controller adjusts the speed of the condenser fans using the VFDs to optimize chiller efficiency and maintain proper head pressure. This feature improves part load efficiency substantially and offers the ability to operate in low ambient conditions down to -10°F. Models 075-241 only.

All High Efficiency Trailblazer® models with fully variable speed fans also include a sound reduction mode to allow for reduced-sound operation. Based on a user-settable time schedule, the chiller will enter the reduced noise mode, which will limit the speed of the condenser fans in order to reduce sound levels. This feature is especially helpful in areas that have more rigorous sound restrictions during certain times of day. While the lower fan speed may have a slight impact on the maximum unit capacity during hot outdoor conditions, the chiller can be set to automatically override the fan speed restrictions if additional capacity is needed. This way, the unit will always optimize between required capacity and the lowest sound level possible.

Low Ambient Control (Factory Installed)

Optional fan VFD control allows unit operation down to -10°F (-23°C). Not available on 380 volt (60 Hz) units.

High Ambient Control Panel

Includes an exhaust fan with rain hood, two inlet screens with filters, necessary controls and wiring. Required for operation from 105°F to 125°F (40°C to 52°C) ambient temperature. This panel is included on units with Low Ambient Control, regardless of ambient temperature, to dissipate additional VFD heat.

Power Factor Correction Capacitors

Option to add power factor correction capacitors to improve the chiller's power factor. Compressor power factor is corrected to approximately 0.95 at standard conditions.

Water Flow Switch (Factory-Supplied)

A factory-included thermal dispersion flow switch is necessary to avoid evaporator freeze-up under low or no flow conditions. A thermal dispersion flow switch will be factory-installed on package models. On remote evaporator models, the flow switch may be separately field-provided, or optionally shipped loose with the unit for field installation. Terminals are provided in the unit control center for field hook-up of the water flow switch.

Alarm Bell (Field Installed)

Field installed and wired to the control panel to provide remote indication of unit alarm condition.

Remote Operator Interface Panel (Field Installed)

A remote interface panel, field wired to the unit, providing all the data viewable on the unit's controller, including alarm clearing and setpoint change capability. See "SiteLine™ Building Controls" on page 5 for details.

BAS Interface - Open Choices™ (Field Installed)

The preferred module is shipped loose for field installation on the Microtech® III controller to provide the interface to the following standard protocols:

- BACnet®/IP
- Modbus®
- BACnet® Ethernet
- LonMark®

SiteLine™ Building Controls

SiteLine from Daikin Applied is a secure, scalable, cloud-based controls solution that can optimize the performance of equipment and building systems. SiteLine provides real-time analytics for energy management, indoor air quality (IAQ) and sustainability. BAS installation is easy with out-of-the box functionality for both new and retrofit applications.

Electrical Options and Accessories

Single-Point Electrical Connection

Provides a single power connection to the unit power block with compressor circuit breakers or to a disconnect switch with compressor circuit breakers. Either option also available without circuit breakers.

Multi-Point with Disconnect Switch

Provides a disconnect switch mounted inside the power section of the control box with a through-the-door handle for each circuit and no compressor circuit breakers. Requires field-installed circuit protection.

Phase Loss/Voltage Protection

Phase loss with under/over voltage protection and multiple LED indication of fault type is available as a factory-installed option to guard against compressor motor burnout.

Convenience Outlet

10.0 amp, 115 volt Ground Fault Circuit Interruption (GFCI) outlet in control panel for servicing unit.

Ground Fault Protection

Protects equipment from damage from line-to-ground fault currents less than those required for conductor protection.

High Short Circuit Current Rating (HSCCR)

Provides control panel with high short circuit current rating with a single-point disconnect breaker switch.

Table 26: Standard and HSCCR Panel Ratings

Panel Type	208V / 230V	380V / 400V / 460V	575V
Standard	5kA	5kA	5kA
HSCCR	65kA	65kA	25kA

Electronic Expansion Valve

An electronic expansion valve is optional on 031-071 models, which have thermal expansion valves as standard.

Unit Options and Accessories

Remote Evaporators

Trailblazer® models have an evaporator shipped separately for field installation and piping to the outdoor unit. Refrigerant piping information on models with remote evaporators can be found in the current product Installation and Operation Manual, available at www.DaikinApplied.com.

Pump Packages

The on-board, integrated chilled water pump package is available with single or dual pump configurations. See page 5 for general information, and refer to the current product Installation and Operation Manual, available on www.DaikinApplied.com, for detailed information.

Partial Heat Recovery

Partial heat recovery (available on 075-241 models) adds optional factory-installed heat exchangers and control logic to provide hot water for many uses such as dehumidification and pre-heating water for a boiler. See page 14 for general information, and refer to the current product Installation and Operation Manual, available on www.DaikinApplied.com, for detailed information.

IBC/OSHPD Seismic Certification

Daikin 030-241 models have been tested and certified by an independent agency — experts in seismic analysis and design — to meet IBC seismic and OSHPD pre-approval. The SDS (design spectral response acceleration at short period) level varies by model size and other factors. The chiller must be installed with either the seismic rated springs, or the neoprene pads provided with the unit. Find more information about seismic requirements and HVAC systems at www.DaikinApplied.com. Seismic option not available with select options. Contact your local sales representative for more details.

Vibration Isolators (Field Installed)

Spring or neoprene-in-shear vibration isolators are available for field installation to reduce vibration transmission through the unit base. Seismic rated spring isolators are available for units requiring seismic certification.

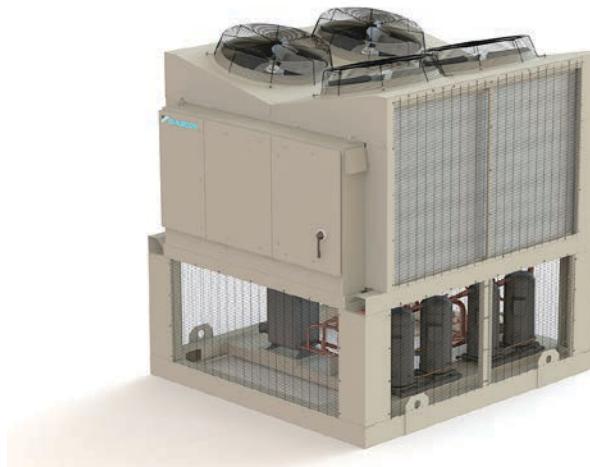

Wind Load Rated

AGZ-E models have been evaluated to withstand up to 186 mph winds when ordered with this option. Contact the local Daikin Applied sales representative with your specific installation requirements.

Protective Base Guards

Optional factory-installed, vinyl-coated, welded-wire base guards provide around lower section protection on ground level installations.

Figure 53: Unit with Base Guards

Louvers (Base and/or Coil)

Available for the upper portion or both the upper and lower portions of unit (upper not required on 030/031 and 035/036 models). Selecting both will completely enclose the unit with louvers. The louvers protect the coils from hail damage.

Figure 54: Unit with Louvered Panels

Epoxy Coated Fins

Microchannel coils coated with baked epoxy protective coating with 10,000+ hour salt spray resistance (ASTM B117-90).

Evaporator Insulation

Double insulation thickness (total of 1.5 inches) for high humidity areas or low fluid temperatures.

Sound Reduction

Acoustical blankets are factory installed on each compressor. They are also available for retrofit field installation.

Shut-off Valves

Suction valves (one per circuit), liquid line shutoff valves, and discharge shutoff valves can be factory mounted.

Chicago Code Relief Valves

Unit will be provided with factory-mounted relief valves to meet Chicago code requirements.

Evaporator Inlet Strainer

Field-installed evaporator water strainer kit consisting of Y-type strainer, blowdown valve, pipe extension with two Schrader fittings and two grooved couplings. Details on page 12.

Replaceable Core Filter Drier

Factory-installed filter drier with a replaceable core allows for fast replacement of filter element and easier serviceability.

TRAILBLAZER® AIR-COOLED SCROLL COMPRESSOR CHILLERS

PART 1--GENERAL

1.01 SUMMARY

- A. Section includes design, performance criteria, refrigerants, controls, and installation requirements for air-cooled scroll compressor chillers.

1.02 REFERENCES

- A. Comply with applicable Standards/Codes of AHRI 550/590, ANSI/ASHRAE 15, ETL, cETL, NEC, and OSHA as adopted by the State.
- B. Units shall meet the efficiency standards of the current version of ASHRAE Standard 90.1, and FEMP Standard 2012.

1.03 SUBMITTALS

- A. Submit shop drawings and product data in accordance with the specifications.
- B. Submittals shall include the following:
 1. Dimensioned plan and elevation view drawings, required clearances, and location of all field connections.
 2. Single-line schematic drawing of the power field hookup requirements, indicating all items that are furnished.
 3. Schematic diagram of control system indicating points for field interface/connection.
 4. Diagram shall fully delineate field and factory wiring.
 5. Installation manuals.

1.04 QUALITY ASSURANCE

- A. Qualifications: Equipment manufacturer must specialize in the manufacture of the products specified and have five years experience with the type of equipment and refrigerant offered.
- B. Regulatory Requirements: Comply with the codes and standards specified.
- C. Chiller manufacturer's plant must be ISO registered.

1.05 DELIVERY AND HANDLING

- A. [Packaged Chillers Only: Chiller shall be delivered to the job site completely assembled and charged with refrigerant and oil by the manufacturer.] [Remote Evaporator models only: The outdoor unit shall be delivered to the job site with condensing section completely assembled and a holding charge of inert gas.]
- B. Comply with the manufacturer's instructions for rigging and handling equipment.

1.06 WARRANTY

- A. The refrigeration equipment manufacturer's guarantee shall be for a period of one year from date of

equipment start-up but not more than 18 months from shipment. The guarantee shall provide for repair or replacement due to failure by material and workmanship that prove defective within the above period, excluding refrigerant.

1.07 MAINTENANCE

- A. Maintenance of the chillers shall be the responsibility of the owner and performed in accordance with the manufacturer's instructions.

PART 2--PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

- A. Daikin Applied
- B. (Approved Equal)

2.02 UNIT DESCRIPTION

- A. Provide and install as shown on the plans factory assembled, factory-charged air-cooled packaged chillers in the quantity specified. Each chiller shall consist of hermetic dual or triple scroll compressor sets (total four or six compressors), brazed plate evaporator, air-cooled condenser section, microprocessor-based control system and all components necessary for controlled unit operation.
- B. Chiller shall be functionally tested at the factory to ensure trouble-free field operation.

2.03 DESIGN REQUIREMENTS

- A. General:[Packaged Chillers: Provide a complete scroll compressor packaged chiller as specified herein and as shown on the drawings. The unit shall be in accordance with the standards referenced in section 1.02 and any local codes in effect.] [030-241 remote models: Provide a complete scroll compressor chiller system consisting of an outdoor compressor-condenser section and a remote indoor evaporator as specified herein and as shown on the drawings. The unit shall be in accordance with the standards referenced in section 1.02 and any local codes in effect.]
- B. Performance: Refer to the schedule of performance on the drawings. The chiller shall be capable of stable operation to a minimum percentage of full load (without hot gas bypass) of 25%. [17% for 6 compressor units]. Performance shall be in accordance with AHRI Standard 550/590.
- C. Flow Range: The chiller shall have the ability to support variable flow range down to 40% of nominal design (based on AHRI conditions).
- D. Operating Range: The chiller shall have the ability to control leaving chilled fluid temperature from 15°F (-9°C) to 65°F (18°C).
- E. Acoustics: Sound pressure levels for the unit shall not

exceed the following specified levels. The manufacturer shall provide the necessary sound treatment to meet these levels if required. Sound data shall be provided with the quotation. Test shall be in accordance with AHRI Standard 370.

Sound Pressure (at 30 feet)											
63 Hz	125 Hz	250 Hz	500 Hz	1000 Hz	2000 Hz	4000 Hz	8000 Hz	Overall dBA	75% Load dBA	50% Load dBA	25% Load dBA
<hr/>											
Sound Power											
63 Hz	125 Hz	250 Hz	500 Hz	1000 Hz	2000 Hz	4000 Hz	8000 Hz	Overall dBA	75% Load dBA	50% Load dBA	25% Load dBA

2.04 CHILLER COMPONENTS

A. Compressors

- The compressors shall be sealed hermetic, scroll type with crankcase oil heater and suction strainer. The compressor motor shall be refrigerant gas cooled, high torque, hermetic induction type, two-pole, with inherent thermal protection on all three phases and shall be mounted on RIS vibration isolator pads. The compressors shall be equipped with an internal module providing compressor protection and communication capability.

[Optional] Provide power factor correction capacitors for each compressor in order to raise compressor power factor to 0.95 at standard rating conditions. Capacitors shall be housed in a separate NEMA 3R rated enclosure and shall have fusing to protect the capacitors from over current. Fuse indicator lights shall be provided to provide visual indication that a fuse has blown.

B. Evaporators

- The evaporator shall be a compact, high efficiency, dual circuit, brazed plate-to-plate type heat exchanger consisting of parallel stainless steel plates.
- The evaporator shall be protected with an external, electric resistance heater plate. The evaporator shall be insulated with 3/4" (19 mm) thick CFC and HCFC-free closed-cell flexible elastomeric foam insulation material with 100% adhesive coverage. The insulation shall have an additional outer protective layer of 3mm thick PE embossed film to provide superior damage resistance. Insulation without the protective outer film shall not be acceptable. UV resistance level shall meet or exceed a rating of 'Good' in accordance with the UNI ISO 4892 - 2/94 testing method. This combination of a heater plate and insulation shall provide freeze protection down to -20°F (-29°C) ambient air temperature.
- The water-side working pressure shall be a minimum of 435 psig (3000 kPa). Vent and drain connections shall be provided in the inlet and outlet chilled water piping by the installing contractor. Evaporators shall be designed and constructed according to, and listed by, Underwriters Laboratories (UL).

[OPTIONAL] The evaporator shall have 1.5-inch

(38 mm) CFC and HCFC-free closed-cell flexible elastomeric foam insulation material with 100% adhesive coverage.

C. Condenser

- Condenser fans shall be propeller type arranged for vertical air discharge and individually driven by direct-drive fan motors. The fans shall be equipped with a heavy-gauge vinyl-coated fan guard. Fan motors shall be TEAO type with permanently lubricated ball bearings, inherent overload protection, three-phase, direct-drive, 1140 rpm. Each fan section shall be partitioned to avoid cross circulation.
- Coil shall be microchannel design and shall have a series of flat tubes containing multiple, parallel flow microchannels layered between the refrigerant manifolds. Tubes shall be 9153 aluminum alloy. Tubes made of 3102 alloy or other alloys of lower corrosion resistance shall not be accepted. Coils shall consist of a two-pass arrangement. Each condenser coil shall be factory leak tested with high-pressure air under water.

[Standard Microchannel Coil] Coils shall withstand 1000+ hour acidified synthetic sea water fog (SWAAT) test (ASTM G85-02) at 120°F (49°C) with 0% fin loss and develop no leaks.

[Epoxy-coated Microchannel Option] Condenser coils shall include baked epoxy coating providing 10,000+ hour salt spray resistance (ASTM B117-90).

D. Refrigerant Circuit

- Each of the two refrigerant circuits shall include a refrigerant filter drier, sight glass with moisture indicator, liquid line solenoid valve (no exceptions), expansion valve, and insulated suction line.

[Optional] Each of the two refrigerant circuits shall include a replaceable-core refrigerant filter drier, sight glass with moisture indicator, liquid line solenoid valve (no exceptions), expansion valve, and insulated suction line.

E. Construction

- Unit formed sheet metal components shall be painted using a corrosion resistant paint system, for aesthetics and long-term durability. Paint system will include a base primer with a high-

quality polyester resin topcoat. Painted galvanized parts shall be G60 or greater and finished, unabraded panel surfaces shall be capable to be exposed to an ASTM B117 salt spray environment and exhibit no visible red rust at a minimum of 3,000 hours exposure. Finished, abraded surfaces shall be tested per ASTM D1654, having a mean scribe creepage not exceeding 1/16" at 1,000 hours minimum exposure to an ASTM B117 salt spray environment.

2. Options

- a. Painted steel wraps enclosing the coil end sections and piping
- b. Protective, 12 GA, PVC-coated, wire coil guards for the vertical upper coil section of the unit
- c. Protective, 12 GA, PVC-coated, wire base guards for the lower section of the unit
- d. Protective and decorative louvers for upper section of the unit, covering the coils and unit end.
- e. Protective and decorative louvers for lower section of the unit

F. Control System

1. A centrally located weatherproof control panel shall contain the field power connection points, control interlock terminals, and control system. Box shall be designed in accordance with NEMA 3R rating. Power and starting components shall include factory circuit breaker for fan motors and control circuit, individual contactors for each fan motor, solid-state compressor three-phase motor overload protection, inherent fan motor overload protection and two power blocks (one per circuit) for connection to remote, contractor supplied disconnect switches. Hinged access doors shall be lockable. Barrier panels or separate enclosures are required to protect against accidental contact with line voltage when accessing the control system.

2. Options

- a. [Shall include standard multi-point power blocks.]
- b. [Shall include single-point power connection to power block with compressor circuit breakers (Customer-supplied disconnect required).]
 - [Shall include single-point connection to a non-fused disconnect switch with through-the-door handle and compressor circuit breakers.]
- c. [Shall include multi-point disconnect switches (one per circuit).]
- d. [Shall include high short circuit current rating of 65,000 amps (25,000 amps at 575 Volt) with single-point disconnect switch.][Shall include multi-point disconnect switches (one per circuit).]

G. An advanced DDC microprocessor unit controller with a 5-line by 22-character liquid crystal display provides

the operating and protection functions. The controller shall take preemptive limiting action in case of high discharge pressure or low evaporator pressure. The controller shall contain the following features as a minimum:

1. Equipment Protection

- a. The unit shall be protected in two ways: (1) by alarms that shut the unit down and require manual reset to restore unit operation and (2) by limit alarms that reduce unit operation in response to some out-of-limit condition. Shutdown alarms shall activate an alarm signal.

b. Shutdown Alarms:

- No evaporator water flow
- Sensor failures
- Low evaporator pressure
- Evaporator freeze protection
- High condenser pressure
- Outside ambient temperature (auto-restart)
- Motor protection system
- Phase voltage protection (Optional)

c. Limit Alarms

- Condenser pressure stage down, unloads unit at high discharge pressures
- Low ambient lockout, shuts off unit at low ambient temperatures
- Low evaporator pressure hold, holds stage #1 until pressure rises
- Low evaporator pressure unload, shuts off one compressor

d. Unit Enable Selection

- Enables unit operation from either local keypad, digital input, or BAS

e. Unit Mode Selection

- Selects standard cooling, ice, glycol, or test operation mode

f. Analog Inputs

- Reset of leaving water temperature, 4-20 mA
- Current Limit

g. Digital Inputs

- Unit off switch
- Remote start/stop
- Flow switch
- Ice mode switch, converts operation and setpoints for ice production
- Motor protection

h. Digital Outputs

- Shutdown alarm; field wired, activates on an alarm condition, off when alarm is cleared
- Evaporator pump; field wired, starts pump

- when unit is set to start
- i. Condenser Fan Control
 - The unit controller shall provide control of condenser fans based on compressor discharge pressure.
 - j. Building Automation System (BAS) Interface
 - Factory mounted DDC controller(s) shall support operation on a BACnet®, Modbus® or LonMark® network via one of the data link / physical layers listed below as specified by the successful Building Automation System (BAS) supplier.
 - BACnet® MS/TP master (Clause 9)
 - BACnet® IP, (Annex J)
 - BACnet® ISO 8802-3, (Ethernet)
 - LonMark® FTT-10A. The unit controller shall be LonMark® certified.
 - The information communicated between the BAS and the factory mounted unit controllers shall include the reading and writing of data to allow unit monitoring, control and alarm notification as specified in the unit sequence of operation and the unit points list.
 - For chillers communicating over a LonMark® network, the corresponding LonMark® External Interface File (XIF) shall be provided with the chiller submittal data.
 - All communication from the chiller unit controller as specified in the points list shall be via standard BACnet® objects. Proprietary BACnet® objects shall not be allowed. BACnet® communications shall conform to the BACnet® protocol (ANSI/ASHRAE135-2001). A BACnet® Protocol Implementation Conformance Statement (PICS) shall be provided along with the unit submittal.

2.05 OPTIONS AND ACCESSORIES

The following optional items shall be furnished:

- A. RapidRestore® and Fast Loading: The chiller shall be equipped with the capability to restart and to reach full load more quickly than standard in case of a power interruption. The chiller shall be capable of rapidly restarting after power loss duration of up to 180 seconds. The time to restart the chiller shall be a maximum of 125 seconds, and full load shall be achieved in 220 seconds from power restoration.
- B. Fast Loading Stand-By Chiller: The chiller shall be equipped with the capability to start and to reach full load more quickly than standard in the event that the primary chiller system is disabled. The chiller shall be capable of rapidly achieving full capacity. The time to full load shall be achieved in 115 seconds.
- C. [075-241 models only] Partial Heat Recovery: An auxilliary brazed-plate heat exchanger shall be added in each unit refrigerant circuit between the

compressors and the condenser coils. The heat exchangers shall transfer the compressor discharge gas heat to a separate water loop to be used for various heating applications. Water temperature sensors and piping connections shall be factory installed. The amount of heat produced is dependent on the requested cooling load, the operating temperatures, and the water flow rate through the auxilliary heat exchangers. Chiller controller shall supply 0-10V DC or 4-20ma signal for control of a field provided 3-way valve or pump VFD.

- D. Optional Seismic Certification: Provide chiller with seismic rating based on site SDS and importance factor levels. Seismic rating shall consist of OSHPD pre-approval for the model and configuration provided. Ensure rated SDS level is adequate for the installed location. Provide [seismic rated spring isolators] [neoprene pads] for secure mounting of the chiller to the base. Chiller shall be marked with a label showing the applicable OSHPD pre-approval number.
- E. Wind Load Rated: Evaluated to withstand wind speeds up to 186 mph. Provide engineer-stamped certificate that equipment has been evaluated and built to meet the required wind velocity.
- F. Hot Gas Bypass: Allows unit operation to 10% of full load. Includes factory-mounted hot gas bypass valve, solenoid valve, and manual shutoff valve for each circuit. Shall be ready for field piping according to manufacturer instructions.
- G. Low Ambient Control: Fan VFD allows unit operation down to -10°F (-23°C).
- H. High ambient control box for operation in ambient temperatures from 105°F (40°C) to 125°F (52°C).
- I. Ground Fault Protection: Factory installed circuit breaker to protect equipment from damage from line-to-ground fault currents less than those required for conductor protection.
- J. Phase loss with under/over voltage protection and with LED indication of the fault type to guard against compressor motor burnout.
- K. Factory-mounted thermal dispersion flow switch
- L. Field-mounted, paddle type, chilled water flow switch field wired to the control panel
- M. Evaporator inlet strainer, minimum of 0.063" perforations for brazed plate evaporators with extension pipe and grooved couplings (factory mounted or field installed).
- N. Spring vibration isolators (field installed)
- O. Rubber-in-shear vibration isolators (field installed)
- P. Seismic-rated spring isolators (field installed)
- Q. Compressor sound reduction package
- R. Remote operator interface panel (field-wired)
- S. 115V GFI convenience outlet
- T. BAS interface module, factory mounted

2.06 OPTIONAL FACTORY-INSTALLED PUMP PACKAGE

- A. The pump package shall be factory mounted and wired on the chiller. The chiller controller shall provide a pump start/stop signal when operation is required. On dual pump systems, the chiller shall also provide automatic alternating of pump starts and duty/standby functionality. The package shall be equipped with:
 - 1. Single Pump Model 4380: single spring inside-seal, vertical, in-line, radially split-case pump, serviceable without breaking pipe connections. The motor and pump rotating assembly shall be serviceable without removing the pump casing from the line - OR -
 - 2. Dual Pumps in a Single Casting Model 4392: single-spring inside-seal vertical, in-line, radially split-case pumps, mounted in a common casing with a common inlet connection and outlet connection and including a flapper valve to prevent recirculation when only one pump is operating. The pumps shall be designed for duty/standby, not parallel operation.
- B. Pump package shall also be equipped with:
 - 1. "Y" type inlet strainer
 - 2. Combination triple-duty outlet valve having a drip-tight discharge shutoff valve, non-slam check valve, and flow throttling valve
 - 3. Combination suction guide with flow stabilizing outlet vanes and stainless steel strainer with a disposable fine-mesh strainer for start-up
 - 4. Factory power and control wiring from the AGZ chiller to the pump package control panel
 - 5. Flow switch mounted and wired
 - 6. Interconnecting schedule 40 piping with grooved couplings
 - 7. Insulation of all cold surfaces
- C. Pump Package Options
 - 1. Water pressure gauges on the pump suction and discharge
 - 2. Expansion tank with size increments from 4.4 to 90 gallons, field installed (small sizes can be factory mounted)
 - 3. Air separator with air vent, field installed
 - 4. Storage tanks, vertical, insulated, 150, 300, 600, 1000 gallon sizes with optional immersion heater, field installed.
 - 5. Pump VFD for variable chilled water flow capability.

[075-241 models only] Optional Variable Frequency Drive: Flow control through the pump VFD without external pressure sensors. There shall be four selectable operating modes:

- a. Sensorless Operation
- b. **BAS Input:** The pump speed and system flow will be controlled from a customer-supplied BAS input signal.

c. **Remote Sensor Control:** The VFD is wired to a pressure sensor mounted in the chilled water piping system. This is the standard VFD control when a sensorless VFD is not used.

d. **Locally Selected Constant Speed Control:** Provides manual control of the pump speed, overriding any current automatic speed control.

Control software shall provide automatic speed control in variable volume systems without the need for pump mounted (internal/external) or remotely mounted differential pressure system feedback sensor. Control mode setting and minimum / maximum head and flow set-points shall be set at the factory and be user adjustable via the built-in programming interface.

PART 3--EXECUTION

3.01 INSTALLATION

- A. Install in strict accordance with manufacturer's requirements, shop drawings, and contract documents.
- B. Adjust and level chiller in alignment on supports.
- C. Coordinate electrical installation with electrical contractor.
- D. Coordinate controls with control contractor.
- E. Install a required cleanable, field-supplied strainer in the chilled water return line at the evaporator inlet per the guidelines in the installation manual.

3.02 START-UP

- A. Provide testing and starting of machine, and instruct the Owner in its proper operation and maintenance.

**DAIKIN APPLIED AMERICAS INC.
LIMITED PRODUCT WARRANTY
(North America)**

Daikin Applied Americas Inc. dba Daikin Applied ("Company") warrants to contractor, purchaser and any owner of the product (collectively "Owner") that Company, at its option, will repair or replace defective parts in the event any product manufactured by Company, including products sold under the brand name Daikin and used in the United States or Canada, proves defective in material or workmanship within twelve (12) months from initial startup or eighteen (18) months from the date shipped by Company, whichever occurs first. Authorized replaced parts are warranted for the duration of the original warranty. All shipments of such parts will be made FOB factory, freight prepaid and allowed. Company reserves the right to select carrier and method of shipment.

In addition, labor to repair or replace warranty parts is provided during Company normal working hours on products with rotary screw compressors and centrifugal compressors. Warranty labor is not provided for any other products.

Company's liability to Owner under this warranty shall not exceed the lesser of the cost of correcting defects in the products sold or the original purchase price of the products.

PRODUCT STARTUP ON CENTRIFUGAL AND SCREW COMPRESSOR PRODUCTS IS MANDATORY and must be performed by a Daikin Applied or a Company authorized service representative.

It is Owner's responsibility to complete and return the Registration and Startup Forms accompanying the product to Company within ten (10) days of original startup. If this is not done, the ship date and the startup date will be deemed the same for warranty period determination, and this warranty shall expire twelve (12) months from that date.

EXCEPTIONS

1. If free warranty labor is available as set forth above, such free labor does not include diagnostic visits, inspections, travel time and related expenses, or unusual access time or costs required by product location.
2. Refrigerants, fluids, oils and expendable items such as filters are not covered by this warranty.
3. This warranty shall not apply to products or parts which (a) have been opened, disassembled, repaired, or altered by anyone other than Company or its authorized service representative; or (b) have been subjected to misuse, negligence, accidents, damage, or abnormal use or service; or (c) have been operated, installed, or startup has been provided in a manner contrary to Company's printed instructions, or (d) were manufactured or furnished by others and which are not an integral part of a product manufactured by Company; (e) have been exposed to contaminates, or corrosive agents, chemicals, or minerals, from the water supply source, or (f) have not been fully paid for by Owner.

ASSISTANCE

To obtain assistance or information regarding this warranty, please contact your local sales representative or a Daikin Applied office.

SOLE REMEDY

THIS WARRANTY CONSTITUTES THE OWNER'S SOLE REMEDY. IT IS GIVEN IN LIEU OF ALL OTHER WARRANTIES. THERE IS NO IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. IN NO EVENT AND UNDER NO CIRCUMSTANCE SHALL COMPANY BE LIABLE FOR INCIDENTAL, INDIRECT, SPECIAL, CONTINGENT OR CONSEQUENTIAL DAMAGES, WHETHER THE THEORY BE BREACH OF THIS OR ANY OTHER WARRANTY, NEGLIGENCE OR STRICT LIABILITY IN TORT.

No person (including any agent, sales representative, dealer or distributor) has the authority to expand the Company's obligation beyond the terms of this express warranty or to state that the performance of the product is other than that published by Company.

For additional consideration, Company will provide an extended warranty(ies) on certain products or components thereof. The terms of the extended warranty(ies) are shown on a separate extended warranty statement.

Daikin Applied Training and Development

Now that you have made an investment in modern, efficient Daikin Applied equipment, its care should be a high priority. For training information on all Daikin Applied HVAC products, please visit us at www.DaikinApplied.com and click on Training, or call 540-248-9646 and ask for the Training Department.

Warranty

All Daikin Applied equipment is sold pursuant to its standard terms and conditions of sale, including Limited Product Warranty. Consult your local Daikin Applied representative for warranty details. To find your local Daikin Applied representative, go to www.DaikinApplied.com.

Aftermarket Services

To find your local parts office, visit www.DaikinApplied.com or call 800-37PARTS (800-377-2787). To find your local service office, visit www.DaikinApplied.com or call 800-432-1342.

This document contains the most current product information as of this printing. For the most up-to-date product information, please go to www.DaikinApplied.com.
